

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. THE ETYMOLOGIES.

The etymologies have been written and 1889 The etymologies have been written ane a uniform plan, and in accordance with the tablished principles of comparative philo. It has been possible in many cases, by not the fresh material at the disposal of etymologist, to clear up doubts or diffict hitherto resting upon the history of partiwords, to decide definitely in favor of or several suggested etymologies, to discard merous current errors, and to give for the time the history of many words of which etymologies were previously unknown or neously stated. Beginning with the curaccepted form of spelling, each important has been traced back through earlier form its remotest known origin. The various preand suffixes useful in the formation of Engwords are treated very fully in separate arti words are treated very fully in separate arti

HOMONYMS.

HOMONYMS.

Words of various origin and meaning of the same spelling, have been distingui by small superior figures (1, 2, 3, etc.). numbering these homonyms the rule has I to give precedence to the oldest or the I familiar, or to that one which is most ne English in origin. The superior numbers ply not so much to the individual word a the group or root to which it belongs, he the different grammatical uses of the shomonym are numbered alike when they separately entered in the Dictionary. The verb and a noun of the same origin and same present spelling receive the same supenumber. But when two words of the same fand of the same radical origin now different eight and of the same radical origin now different words, they are separately numbered.

number. But when two words of the same f and of the same radical origin now differ siderably in meaning, so as to be used as different words, they are separately numbered.

THE ORTHOGRAPHY.

Of the great body of words constituting the familiar language the spelling is determined by well-established usage, and, however accidental and unacceptable, in many cases, it may be, it is not the office of a dictionary like this to propose improvements, or to adopt those won some degree of acceptance and use. But there are also considerable classes as to which usage is wavering, more than one form being sand words and senses not recorded even in the text of the mathematical sciences, of the mechanism of the methanism of the mechanism of the methanism of the mechanism of the methanism of the mechanism of the mechanism of the methanism of the methanism of the mechanism of the mechanism of the methanism of t

About 200,000 words will be defined. The Dictionary will be a practically complete record of all the noteworthy words which have been in use since English literature has existed, especially of all that wealth of new words and of applications of old words which has sprung from the development of the thought and life of the nineteenth century. It will record not merely the written language, but the spoken language as well (that is, all important provincial and colloquial words), and it will include (in the one alphabetical order of the Dictionary and phrases as have become a familiar piecord.

KEY TO PRONUNCIATION.

ā	as in fate, mane, dale.
×	as in far, father, guard.
٨	as in fall, talk, naught.
4	as in ask, fast, ant.
ā	as in fare, hair, bear.
•	as in met, pen, bless.
ě	as in mete, meet, meat.
ě	as in her, forn, heard.
i	as in pin, it, biscuit.
ĭ	as in pine, fight, file.
0	as in not, on, frog.
ō	as in note, poke, floor.
ŏ	as in move, spoon, room.
٥	as in nor, song, off.
**	as in tub son blood

t as in mute, acute, few (also new,

tube, duty : see Preface, pp. ix. x).

a as in fat, man, pang.

oi as in oil, joint, boy. ou as in pound, proud, now.

ù as in pull, book, could.

ü German ü, French u.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

- \$ as in prelate, courage, captain.
- as in ablegate, episcopal.
 as in abrogate, eulogy, democrat.
- ū as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that. even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short u-sound (of but, pun, etc.). See Preface, p. xi. Thus:

- a as in errant, republican.
- as in prudent, difference.

 i as in charity, density.
- ο as in valor, actor, idiot.
- as in Persia, peninsula.
- g as in the book. 0 as in nature, feature.

A mark (\sim) under the consonants t, d, s, s indicates that they in like nanner are variable to ch, j, sh, sh. Thus:

- ; as in nature, adventure. d as in arduous, education.
- s as in leisure.
- z as in seizure.
- th as in thin.
- TH as in then.
- ch as in German ach, Scotch loch,
- n French nasalizing n, as in ton, en ly (in French words) French liquid (mouillé) L
- ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

- < read from; i. e., derived from.
- > read whence; i. e., from which is derived.
- + read and; i. e., compounded with, or with suffix.

 = read cognate with; i. e., etymologically parallel with.
- read theoretical or alleged; i. e., theoretically assumed, or asserted but unverified, form,

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back! (bak), n. The posterior part, etc. back! (bak), a. Lying or being behind, etc.
back! (bak), v. To furnish with a back, etc. back! (bak), adv. Behind, etc. back?† (bak), n. The earlier form of bat?. back3 (bak), n. A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for number, "st." for stanza, "p. for page, "1." for line, I for paragraph, "fol." for folio.
The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only	§ 5.
Chapter only	xiv.

Canto only	
Book and chapter	
Part and chapter	
Book and line	
Book and page	iii. 10.
Act and scene	
Chapter and verse	
No. and page	
Volume and page	II. 34.
Volume and chapter	IV. iv.
Part, book, and chapter	II. iv. 12.
Part, canto, and stanza	II. iv. 12.
Chapter and section or ¶	vii. § or ¶ 3.
Volume, part, and section or ¶	I. i. § or ¶ 6.
Book, chapter, and section or ¶	I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discriminated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [cap.] for "capital" and [l. c.] for "lowercase" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoological and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoology, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoölogical and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers,

1. The seventh letter and fifth consonant in the English alphabet. It is a sign of Italic origin, having been fabricated by the Romans by a slight modification of C, when the distinction of the (hard) g-sound from the k-sound, both until then represented alike by c, was found advisable and was effected. (See Original Colled "hard g" and "soft g" respectively. The former is the value originally belonging to the sign. The "hard" g-sound is the sonant (or voiced, or intonated) correlative of the k-sound, made by a close contact between the upper surface of the back part of the tongue and the adjacent palate, while breath enough to set the vocal chords vibrating is, during the continuance of the contact, forced up into the pharynx—the breach of this contact, as in the case of the other so-called mutes (or stops, or checks), giving the alphabetic element. The k-and g-sounds are most often called the guttural mutes; although (since the guttur proper has nothing to do with their formation) many authorities prefer to call them palatad, or back-palatad. The "soft" sound of g in English is compound (= j = dzh), the sonant correlative of the ck-sound (see ch); it is, like the soft e-sound in relation to hard c, a product of the alteration of the hard g, the point of contact being shifted forward on the tongue, and a spirant or sibiliant vanish being added to the mute element. It belongs mainly to the Romance part of the language. It never occurs at the end of such words (before "silent" e, as in hinge, singe, singe, singe, singe). Except in such instances, g, in words of Germanic origin, is hard also before e and i. The principal digraphs containing g are gh and gg. The former is written instead of the earlier guttural spirant h (as night for earlier nith), and is either silent (as in night) or pronounced as f(as in laugh). With the digraph ng is written the nasal which corresponds to g and k in the same manner as n to d and t, or ns to b and p, and which (for example, in singing) is just as much a simple sound as nor m.

gabbro (gab'rō), n. [A word of obscure origin used in Italy, but more especially in the neighborhood of Florence, and by the marble-workers there, and introduced into lithological science by Von Buch in 1809.] A rock of varied lithological character, essentially, according to the present general acceptation of the name among lithologists, a crystalline-granular aggregate of plagioclase and diallage, with which often occur magnetite (or menachanite) and apatite. Often the diallage is associated with a rhombic gregate of plagioclase and diallage, with which often occur magnetite (or menachanite) and apatite. Often the diallage is associated with a rhombic pyroxene (bronzite or hypersthene, two closely allied members of the augite or pyroxene family), and when this predominates the rock passes into what is called norite. Olivin is also frequently present, and the predominance of this mineral gives rise to combinations to which the names olivin-gabbro and olivin-norite have been given. The original gabbro of von Buch, now called sausavrite-gabbro, is one of the many alterative forms of gabbro proper, which is perhaps the most perplexing of all rocks in respect to the manifold nature of the alterations it is liable to undergo. In regard to the nomenclature of many of these there is not much present unity among lithologists. Gabbro roses (It., red gabbro), a rock occurring at the junction of the serpentine and the macigno (a micaceous sandstone) of Tuscany, is an altered sedimentary formation very variable in texture and composition. Gabbro worde (It., green gabbro), or gabbro simply, as it is sometimes called, is serpentine. The gabbro verde of Tuscany does not contain dialiage; the rock called gabbro in Corsica, on the other hand, has crystals of dialiage disseminated through the serpentine. Verde di Corsica (It., Corsica green), a variety of gabbro now called by Italians grantone and eu/otide (euphotide), is the beautiful green stone extensively employed in the interior decorations of the Medicean chapel in Florence. It is a crystalline aggregate of saussurite and smaragdite (a grass-green variety of hornblende). See hypersthenite.

extract.

At Hundon, in Lincolnshire, there is still annually practised on this day [Palm Sunday] a remarkable custom, called gad cracking, . . . which is fully explained in the following petition, presented to the House of Lords in May, 1836, by the lord of the manor; but without effect, as the ceremony was repeated in 1837: . . . A cart-whip of the fashion of several centuries since, called a gad-whip, . . . is, during divine service, cracked in the church-porch. Hampson, Medii Ævi Kalendarium (1841), I. 182.

gadfly (gad'fli), n.; pl. gadflies (-fliz). [< gad¹
+ fly². Cf. gad¹ and gadbee in the same sense.]
1. The popular name of sundry flies which
goad or sting domestic animals, as a breeze,
breeze-fly, or horse-fly; specifically, a dipterous insect of the

family Tabani-dæ and subor-der Brachycera, representing also a superfamily Herachata. They are compara-tively large, very active, voracious, and bloodthirsty, active, voracious, and bloodthirsty, with great powers of biting, the mouth-parts being more highly developed than those of any other dipterous insect. They have also great power of flight.

power of flight.
The bite is deep and painful, often drawing blood, though not poisonous. In strictness, only the females are gadfies, the males being smaller and quite inoffensive, living on juices of plants. There are more than 1,000 species, of the genera Tabanus, Chrysops, Hæmatopota, and others. One of the commonest gadfiles which attack cattle and horses is Tabanus bovinus. See also cut under Chrysops.

Gadidæ (gad'i-dē), n. pl. [NL., < Gadus + -idæ.] A family of anacanthine or soft-finned fishes, of the order Teleocephali and suborder Anacanthini, typified by the genus Gadus; the Anacanthini, typified by the genus Gadus; the cods. They have subgular ventral fins; the dorsal and anal fins diversiform; the raylets of the caudal fin precurrent above and below; and the body conoidal behind, with nearly median anus and terminal mouth. The Gadidæ are the most diversiform family of the suborder. The subfamilies are Gadinæ, Phycinæ, and Lotinæ, the last containing the burbots and the lings. Besides the cod, the haddock, whiting, pollack, and ling are the leading representatives of the family. The name has often been used with greater latitude of definition than that here given, being in the older systems equivalent to the Cuvierian Gadides or Gadites. See cod.

Gadinæ (gā-di'nē), n. pl. [NL., < Gadus + -inæ.] The typical subfamily of anacanthine fishes of the family Gadidæ, distinguished by the development of three dorsal and two anal fins, with moderate ventrals; the true codfishes. It contains the most important of all food-fishes,

=Syn. 1. Gag, Muzzle, Muffe; stiffe. To gag is to silence
by thrusting something into the mouth and securing it in
place. To muzzle a dog, or other creature having a projecting mouth, is to incase the mouth and nose (muzzle)
in a framework called a muzzle, in order to prevent him
from biting or eating. Both gag and muzzle are sometimes used figuratively for the act of silencing effectively
by moral compulsion, gag implying also roughness or say
verity in the performance: as, a muzzled press; to gag a
public speaker by threats of violence. To muffe is primarily to conceal by wrapping up, but the word has a secondary use to express the deadening of sound, by wrapping

1. A vegetable excrescence produced by the deposit of the egg of an insect in the bark or leaves of a plant, ordinarily due to the action of some virus deposited by the female along with the egg, but often to the irritation of the larva. Galls made by Cynipidæ are of the former kind; but some other hymenopters, as certain saw-files, and many lepidopters, differs, coleopters, and hemipters are also gall-makers. The galls of commerce are produced by a species of Cynips which deposits its eggs in the tender shoots of the Quercus Lusicanica (Q. infectoria), a species of oak abundant in Asia Minor, Syria, Peris, etc. Galls are inodorous, and have a nauseously bitter and astringent taste. They are nearly spherical, and vary from the size of a pea to that of a hazelnut. When good, they are of a blue, black, or deep-olive color. They

are also termed nutgalls or gallnuts, and are known in commerce by the names of white, green, and blue. The two latter kinds are the best. The chief products of galls are tannin or gallotannic acid, of which the best galls yield from 60 to 70 per cent. Galls from other species of oak, as well as from other kinds of trees, are met with in commerce and are used for dyeing and tanning, as tamarisk-galls from Tamaris orientalist, Chinese galls from Rhus semialata, and Bokhara galls from various species of Pistacia. These galls are of very various forms and sizes.

The earliest ships of all nations were of this class, and were at first confined chiefly to coasting or to the navigation of narrow seas. The war-galley of the Greeks originally had a single mast carrying one square sail amidahips, and later two masta, but depended primarily upon its oars, ranged in a single line on each side, and each handled by one rower. It was rated according to the whole number of these. The principal sizes were the triacouter, of thirty oars, and the pendeconter, of fifty. Ships of this form continued to be used as vessels of burden, but were early superseded for war by galleys rated according to the number of banks of oars or ranks of rowers, as the bireme (a two-banked vessel), trireme, quadrireme, etc. Greater numbers of banks are mentioned, up to forty banks of oars in a vessel of enormous size built for Ptolemy Philopator of Egypt. How these numerous banks of oars were arranged is not definitely known; it is probable that not more than three could have been placed one above another. The first recorded Roman fleet consisted wholly of trireme, and this was always the most common armament. The ancient naval vessels were long, sharp, and narrow in mode

extinct in France. Pussy, Eirenicon, p. 270.

The Gallican theory [of church government] views the Church as a constitutional monarchy, of which the Pope is either Jure Divino, or merely Jure Ecclesiastico, the responsible head; invested with legislative and executive functions while the supreme representative power of the Church, the Œcumenical Council, is in abeyance; but owing implicit obedience to such a Synod when assembled, lable to be suspended or deposed by it, and compelled to submit to its decisions on pain of the guilt and the consequences of schism.

J. M. Neale, Eastern Church, i. 15.

Gallican Church, the branch of the Roman Catholic Church in France, which has enjoyed greater privileges and had a more independent development than the branches

of that church in other European countries. Its comparative independence has been due to the persistent resistance of the civil power, supported by a portion of the clergy and people distinctively called the Gallican party, to the encroachments of the papal power; but there has always been a strong ultramontane party in the French church favorable to papal claima.—Gallican liberties, the peculiar privileges enjoyed by the Gallican Church. In general they consisted of greater freedom from papal domination over the actions of the bishops and of the king than was customary in other Roman Catholic countries, or than is customary in france at the present time. These liberties were especially defined by the pragmatic sanction of Louis IX. in 1289, by the pragmatic sanction of Charles VII. in 1438, and by the "Declaration of the Clergy "drawn up by Bossuet in 1682, which asserted the right of the king to intervene in church matters without papal interference. The Gallican liberties were confirmed under the rule of Napoleon I, but the French church is becoming increasingly ultramontane.—Gallican liturgies, Gallican liturgy, the liturgies or group of liturgies anciently used in Gaul or France and in some adjacent countries, especially in Spain. In Gaul these liturgies were suppressed by Charlemagne and his successors in the inith century, and the Boman office was substituted for them. The remains of these rites are few and fragmentary. The wording of some of the prayers in the different local uses differed greatly, but the important features and the arrangement of parts were the same throughout. The liturgies originally used in Spain were of the same class, so that the group has been called the Hispano-Gallican family of liturgies. In Spain these rites had by the eleventh century become almost entirely supplanted by the Roman, but at the beginning of the sixteenth century the typical Spanish form, known as the Mozarabic liturgy, was revived by Cardinal Ximenes. The ancient liturgies of the British, Irish, and Scotch app

Also spelled galvanise. Also spelled galvanise.

Galvanized iron, a name given (a) improperly to sheets of iron coated with zinc by a non-galvanic process, the iron being first cleansed by friction and the action of dilute sulphuric acid, and then plunged into a bath composed of melted zinc and other substances, as sal ammoniac, or mercury and potassium; (b) properly, to sheets of iron coated first with tin by a galvanic process, and then with zinc by immersion in a bath containing fluid zinc covered with sal ammoniac mixed with earthy matter.

galvanography (gal-va-nog'ra-fi), n. [As gal-vanograph + -y.] A process for producing plates which will give impressions after the manner of a plate used in copperplate engravmanner of a plate used in copperplate engraving. The drawing is made on a silvered plate in viscid paints, in such a way as to leave the dark parts slightly raised. An electrotype is taken from this, which may be used as an engraved plate, the dark lines now being depressed precisely as in a copperplate. An impression from such a plate is called a paivanograph.

galvanologist (gal-va-nol'o-jist), n. [< galvanology + -ist.] One who describes the phenomena of galvanism.

The term galvanometer is applied to an instrument for measuring the strength of electric currents by means of the deflection of a magnetic needle round which the current is caused to flow through a coil of wire.

S. P. Thompson, Elect. and Mag.

Aperiodic galvanometer, a dead-beat or thoroughly damped galvanometer.—Astatic galvanometer, an instrument which consists of a pair of similar needles magnetized, with their poles turned opposite ways, and stiffly connected at their centers, so that both will swing together.

Astatic Galvanometer.

The one tends always to turn in a direction opposite to the other under the earth's magnetic attraction, so that if the needles were perfectly alike they would form a perfectly satatic pair, or a pair that would not tend to assume any particular direction from the magnetic influence of the earth. One of the needles, ab, is nearly in the center of the coil, CDEF, through which the current passes; the other, a'b', just above the coil. When a current traverses the coil in the direction of the arrows, the action of all parts of the current upon the lower needle tends to urge the austral pole a toward the boreal pole b to the front, while the upper needle, a'b', is affected principally by the current CD of the coil, which urges the austral pole a' to the front of the figure and the boreal pole b' to the back. Both needles are thus urged to rotate in the same direction by the cur-

rent, and, as the opposing action of the earth is greatly enfeebled by the combination, a much larger deflection is obtained than would be given by one of the needles if employed alone. Galvanometers are also made astatic by the use of a fixed magnet so placed as to counteract the influence of the earth's magnetism.—Ballistic galvanometer, an instrument used to measure the strength of a current which acts for only a very short time, as that produced by the discharge of a condenser. It involves the use of a heavy needle, which takes a relatively long time to swing. The sine of half the angle of the first swing is proportional to the quantity of electricity which has flowed through the coil.—Dead-beat galvanometer, a galvanometer in which the needle is so damped, by induction or otherwise, that on the passage of a current it will move to its final deflection without oscillation.—Differential galvanometer, a form of galvanometer in which the coil consists of two separate wires wound side by side, and used to compare two currents. If the currents are sent in opposite directions through these wires the motion of the needle will be determined by the difference in their intensity; if they were equal the needle would remain stationary.—Sine galvanometer, a magnetic needle poised at the center of a coil of insulated copper wire wound round a vertical circle that may be turned horizontally on its stand. In use the needle and vertical circle are at first both in the magnetic meridian. When a current passes, the needle is deflected, and the vertical coil is turned by the observer until its plane coincides with the magnetic axis of the needle. The strength of the current is as the sine of the angular deviation.

Any sensitive galvanometer in which the needle is directed by the earth's magnetism can be used as a sine galvanometer, provided the frame on which the coils are wound is capable of being turned round a central axis.

S. P. Thompson, Elect. and Mag., p. 167.

wound is capable of being turned round a central axia.

S. P. Thompson, Elect. and Mag., p. 167.

Tangent galvanometer, a very short magnetic needle delicately suspended so as to turn in a horizontal plane. The point about which it turns is at the center of a vertical coil of copper wire through which the current is passed. The diameter of the coil is at least ten or twelve times the length of the needle. The needle is therefore usually not more than half an inch long; and, for convenience of reading its deflections, long light pointers of aluminium or of glass fiber are cemented to its ends. In use the instrument is placed so that the vertical coil of copper wire is in the plane of the magnetic meridian. The current is then sent through the coil, and the angle by which the needle is deflected is read off. The strength of the current then is proportional to the tangent of the angle of deflection, whence the name of the instrument.—
Thomson's mirror galvanometer, the most sensitive galvanometer yet invented. Its needle, which is very short, is rigidly attached to a small, light, concave mirror, and suspended in the center of a vertical coil of very small diameter by a silk fiber. A movable magnet is provided for bringing the needle into the plane of the coil when the latter does not coincide with the magnetic meridian, and also for rendering the needle more or less astatic. Needle, mirror, and magnet weigh only about 1½ grains. At a distance of two or three feet from the mirror is a solid wooden stand, with a graduated scale, facing the mirror. In the stand, just under the center of the scale, a hole is cut, and a fine wire is stretched upright across it. A strong lamp stands behind the opening, so that its light will fall on the mirror and be reflected back on the scale. An image of the wire will thus be constantly thrown on the scale, and the slightest motion of the needle and its mirror will produce a much greater motion of this image. As the current flows the one way or the other the index will move to one s

galvanometrical (gal'va-nō-met'ri-kal), a. Same as galvanometric.

The parts of the stand include . . . the necessary clamping screws for electrical and galvanometrical connections.

galvanoplastic (gal'va-nō-plas'tik), α. [As galvanoplastic + ic.] Pertaining to the reproduction of forms by electrotypy.—Galvanoplastic process, a method of obtaining copies of type, an engraving, a design, etc., by electrical deposition: ordinarily the same as electrotyping. As applied to art-work, the phrase refers to the process of electroplating a plaster model with bronze, the mold being afterward destroyed and the plaster withdrawn, leaving a hollow figure in bronze. As applied to ornamental work in glass, the phrase is used for a method of decorating glass surfaces by means of electroplating, the design being first traced on the glass in some metallic pigment and burned in.

Elifying found that when a root is placed vertically between two electrodes it curves towards the positive electrode—that is, against the direction of the current. In one case (Cabbage) the curvature was towards the negative electrode. Müller (Hettlingen), in repeating Elfvings experiments, found that the curvature was in all cases such as to tend to place the long axis of the root in the plane of the current, the curvature being towards the negative pole. These phenomena are spoken of as "galvanotropism."

cards, dice, or roulette; the games of billiards, draughts, and dominoes; athletic games; the draughts, and dominoes; athletic games; the Floral games. The games of classical antiquity were chiefly public trials of athletic skill and endurance, as in throwing the discus, wrestling, boxing, leaping, running, horse- and charlot-racing, etc. They were exhibited either periodically, usually in honor of some god, as the Olympic, Pythian, Nemean, and Isthmian games of Greece, the Ludi Apollinares at Rome, etc., or from time to time for the amusement of the people, as the Circensian games at Rome. The prizes in the Greek periodical games were generally without intrinsic value, as garlands or wreaths of olive-or laurel-leaves, of parsley, etc.; but at the Panathenalc games of Athens the prizes were quantities of olive-oil from the consecrated orchards, given in a special type of painted amphore, of which a hundred or more might constitute a single prize. The four great Greek national games formed the strongest bond in the nature of a national union between the various independent Greek states. At them any person of Hellenic blood had the right to contest for the victory, the most highly esteemed honor in Greece; and citizens of all states, however hostile, met at these games in peace.

In the common usage of the two terms "betting" and "gaming," they may sometimes be employed interchangeably, but not always. If two persons play at cards for money, they are said to be gambling or gaming; but they are gambling because they lay a wager or make a bet on the result of the game, and therefore to say they are betting is equally appropriate. If two persons lay a wager upon the result of a pending election, it will be said that they are betting, but not that they are gaming. There is no gaming in which the element of the wager is wanting, but there is betting which the term gaming is not commonly made to embrace.

tied in the end of the ganging. Hooks to be used on hall-but trawl-lines are seized to the ends of the gangings with tarred or waxed twine. Cod trawl-hooks are generally provided with an eye at the upper end of the shank. A common way of ganging such hooks is to pass the end of the ganging through the eye of the hook, like threading a needle, and then make a figure-of-eight knot around the standing part of the line. Hooks for such predaceous and sharp-toothed fish as the bluefish and kingfish are often ganged with wire, and those for sharks with an iron chain.

ganglion (gang'gli-on), n.; pl. ganglions, ganglia (-onz, -g). [ζ LL. ganglion, a tumor, ζ Gr. γάγγλιον, a tumor under the skin, on or near a tendon.] 1. An enlargement in the course of a nerve, containing or consisting of a course of a nerve, containing or consisting of a collection of ganglion-cells; any assembly of ganglion-cells. The nervous system of invertebrates generally, and the sympathetic nervous system of vertebrates, consists essentially of a chain or series of ganglia connected by commissures, giving off filaments in various directions, forming plexuses or networks around principal viscera, blood-vessels, and other important organs. Some of the larger sympathetic ganglia are also called plexuses; thus, the semilunar ganglis of the abdomen form the solar plexus. In the cerebrospinal nervous system of vertebrates, ganglia regularly occur on the posterior or sensory roots of the spinal nerves. There are likewise ganglia upon some of the motor or sensorimotor cranial nerves, as the vagus, fifth, and facial. All the masses of gray neurine in the brain are also ganglia, as the optic thalami, corpora quadrigemina, corpora striata, etc.; even the general mass of cortical gray matter, both of the cerebrum and of the cerebellum, constitutes a great ganglion. The principal ganglia have special names. See the phrases below.

ganglion-cell (gang'gli-on-sel), n. In anat., a nerve-cell which has a well-marked nucleus and nucleolus, and sends off one or more processes, usually branching, which connect physiologically with other similar processes of cells, or, in some cases, constitute peripheral nervefibers. In addition to the function which belongs to nervefibers of receiving and transmitting nervous impulses, ganglion-cells may have the function of distributing, increasing, diminishing, and in some cases apparently of initiating such impulses, as well as of being a trophical center for nerve-fibers connected with them. Such cells are abundant in the gray matter of the brain and spinal cord, in the ganglia of the dorsal roots of spinal nerves, and in the ganglia of the dorsal roots of spinal nerves, and in the ganglia of the sympathetic system, and they may exist as acattered cells or form plexuses, as those of Auerbach and Meissner. Besides these unipolar, bipolar, and multipolar cells, cells without processes have been described as ganglion-cells, and called apolar. They are regarded by some as having lost their processes in the course of anatomical and microscopic manipulation, and by others as being embryonic forms. Ganglion-cells, with the nerve-fibers and certain terminal structures, make up the essential parts of the nervous system. See out under retina.

gangue, gang (gang), n. [The first form is a common spelling of gang, after equiv. F. gangue, as used in mining, G. gang = E. gang.] 1. In mining, the non-metalliferous or earthy minerals accompanying the ore in a vein or mineral deposit; the part of a lode which is not called ore, or which has no commercial value; veinore, or which has no commercial value; veinstone. Quartz is the most abundant veinstone; calcite, heavy-spar, fluor-spar, and brown-spar are also commonly found forming more or less of the bulk of the metalliferous lodes. Sometimes the gaugus prevails in the vein to the entire exclusion of ore. The words gaugus and veinstone are not properly used to designate the material with which the ore is associated when this consists chiefly of fragments of the country-rock mingled with flucan, etc. This is what the miners designate as the filling-up. See vein and combl. 6.

1. In Agassiz's system of classification, one of four orders into which the class of fishes was divided. It contained those which have ganoid scales or plates of an angular, rhomboldal, polygonal, or subcircular form, as distinguished from those with placoid, cycloid, or ctenoid scales. As thus framed by Agassiz, the ganoids were an artificial group, including siluroids, plectognaths, lophobranchs, and other teleoat fishes. By Owen the Ganoidei were divided into two suborders, Lepidoganoidei and Placoganoidei. By later authors the group has been restricted and raised to the rank of a subclass.

Specifically—2. A deep sloping ravine, notch, or cleft cutting a mountain-ridge. The term is especially common in the central portion of the Appalachian range, where such openings are of frequent occurrence and are important features in the topography. The principal gaps have specific names, as Manassas Gap and Thoroughfare Gap in Virginia. Where such a gap is a through cut, penetrating to the mountain's base, and giving passage, as it then usually does, to a stream, it is called a water-gap, as the Delaware Water-gap in Pennsylvania; when it indents only the upper part of the ridge, it is called a wind-gap. See notch.

4. A gaping clam; a bivalve mollusk of the family Myidar, as Mya truncata. It has a suboval shell, the valves of which gape or dispart and are truncated at the small end and swollen at the other. The surface is wrinkled concentrically and covered with a palegreenish epidermis, which is continued over the siphons. It is a common inhabitant of the North Atlantic coasts, and lives buried in the sand in a upright position, especially at the mouths of rivers and estuaries near low-water mark. At obb-tide it shows its presence by a hole in the sand left when it withdraws its siphon, and it is found by digging to the depth of a foot or more. These clams are extensively used for the table and for hait. Along the eastern coast of the United States the gaper is commonly known as the soft clam, or in more northern ranges simply as the clam. (See cut under Myidæ.) It has many synonyms in Great Britain: as, at Chichester, pullet; at Southampton, old-maid; at Belfast, cockie-brillion; at Dublin, colier; at Youghal, sugar-loon. On the Pacific coast of the United States the term gaper is applied to various similar bivalves, as species of Glycymeris, Saxidonnus, and Schizothærus.

The W. garlleg is from E. Cf. charlock, hemlock.] 1. An onion-like bulbous plant, Allium sativum, allied to the leek, A. Porrum. It is a native of central Asia, and perhaps of the Mediterranean region, was well known to the ancients, and is still a favorite condiment, especially among the people of southern Europe and most Oriental countries. It has a very strong and to most persons unused to it an unpleasant odor, and an acrid pungent taste. Each bulb is composed of several lesser bulbs, called cloves of garlic, inclosed in a common membranous cost and easily separable. Used as medicine, garlic is a stimulant tonic, and promotes digestion; it has also diuretic and sudorific properties, and is a good expectorant. The name is also applied to other species of the same genus, as the bear's-garlic, A. urinum; the crow- or field-garlic, A. vineale; the wild garlic, A. Moly; the wild meadow-garlic of the United States, A. Canadense, etc.

tuted by Edward III. some time between 1344 and 1350, the uncertainty arising from the early loss of all its original records. Its purpose has been supposed to have been atfirst only temporary. According to the common legend, probably fictitions, King Edward III. picked up a garter dropped by the Countess of Salisbury at a ball, and placed it on his own knee, with the words to his courtiers, in response to the notice taken of the incident, Honi soit qui mad y pense (shamed be he who thinks evil of it). To this incident the foundation, the name, and the motto of the order are usually ascribed. The insignia of the order are the garter, a blue ribbon of velvet edged with gold and having a gold buckle, worn on the left leg; the badge, called the George or great George, a figure of St. George killing the dragon, pendent from the collar of gold, which has twenty-six pleces, each representing a coiled garter; the lesser George, worn on a broad blue ribbon over the left shoulder; and the star of eight points, of silver, having in the middle the cross of St. George encircled by the garter. The vesture consists of a mantle of blue velvet lined with white taffets, a hood and surcost of crimson velvet, and a hat of black velvet with a plume of white ostrich-feathers, having in the center a tuft of black heron-feathers. When the sovereign is a woman, she wears the ribbon on the left arm.—Prick the garter. See fast and loose, under fast!.

gas (gas), n. [A word invented by the Belgian chemist Van Helmont (died 1644), who expressly says "Hunc spiritum, incognitum hactenus, novo nomine gas voco" (this vapor, hitherto unknown, I call by a new name, gas). nactenus, novo nomine gas voco" (this vapor, hitherto unknown, I call by a new name, gas). The word came into general use: D. G. Dan. Sw. gas, F. Pg. gaz, Sp. It. gas, Russ. gasū, Hind. gās, etc. Various guesses have been made at the word which might possibly have suggested the particular syllable gas, as D. geest (AS. gāst, E. ghost), spirit; G. gāscht, froth, foam; Sw. gāsa, ferment, efferversee; F. gaze, gauze, etc.] 1. A substance possessing perfect molecular mobility and the property of indefinite expansion. The term was originally synonymous with air, but was afterward applied to substances supposed (but wrongly—see below) to be incapable of reduction to a liquid or solid state. In accordance with this use a gas was defined to be a permanently elastic fluid or air differing from common air. According to the kinetic theory of gases, now accepted, the molecules of a gas are in a state of rapid motion in right lines, constantly colliding with one another and with the walls of any containing vessel, and hence exerting pressure against them. For example, in the case of air at ordinary temperatures it is calculated that the average velocity of the molecules is about that of a rife-bullet as it leaves the gun. If a gas is compressed into less volume, the number of impacts against the sides of the containing vessel is ingun. If a gas is compressed into less volume, the number of impacts against the sides of the containing vessel is in-

Gases are distinguished from other forms of matter, not only by their power of indefinite expansion so as to fill any vessel, however large, and by the great effect which heat has in dilating them, but by the uniformity and simplicity of the laws which regulate their changes.

Specifically—2. In coal-mining, any explosive mixture of fire-damp with common air.—3. In mixture of fire-damp with common air.—3. In popular language, a compound of various gases, used for illuminating and heating purposes. It is some form of carbureted hydrogen artificially made and distributed by pipes to points of consumption. The common kind is coal-gas, obtained from bituminous coals by carbonization in retorts at a high temperature. A carbureted hydrogen gas, called water-gas, resulting from the passing of steam through a mass of incandescent carbon and the subsequent admixture of hydrocarbons or other enriching substances, is also used. Oil-gas is an illuminating gas obtained by the distilling at high temperature of petroleum or other liquid hydrocarbons.

Absorption of gases. See absorption.— Diffusion of gases. See diffusion.—Effusion of gases. See effusion.—Gas-liquor, liquor separated by condensers from crude coal-gas in the process of manufacture. It contains in solution a number of ammonium compounds which would diminish the illuminating power of the gas, and from which ammonium sulphate and chlorid are manufactured.— Natural gas, combustible gas formed naturally in the earth. It is sometimes found issuing through crevices, but is generally obtained by boring. Natural gas has long been used in western China and elsewhere. It has been found in great abundance in western Pennsylvania and the adjoining region of New York, as also to a limited extent in Ohio, Indiana, and West Virginia. It was first utilized in New York in 1821, and began about 1874 to be of importance commercially, especially in the vicinity of Pittsburgh. The area over which natural gas and petroleum are obtained in quantity, and the conditions of their occurrence, are in most respects essentially the same, but the principal source of the gas in Ohio and Indiana is a formation lower down in the geological series than that furnishing it in Pennsylvania. In the former States the gas comes from the Trenton limestone, a group belonging to the Lower Silurian: in the latter, from the Devonian. The natural gas burned at Pittsburgh contains about 67 per cent of marsh-gas, 22 of hydrogen, 5 of an ethylene compound, 3 of nitrogen, together with a small percentage of carbonic acid, carbonic oxid, oleflant gas, and oxygen.—Rock-gas. Same as natural gas.

gas-fitter (gas'fit'er), n. One whose business is the fitting up of buildings, etc., with all the requisites for the use of illuminating gas.
gas-fixture (gas'fiks'tūr), n. A permanent apparatus for the burning of illuminating gas, including a burner or set of burners and the tube connecting it with a gas-pipe, a key or keys for turning the flow of gas off or on, etc. See gas-bracket and gaselier

bracket and gaselier.
gas-furnace (gas 'fer' nās), n. 1. A furnace heated by the combustion of gas.—2. A furnace for distilling gas from coal or some other form of carbon.

gas-gage (gas'gāj), n. An instrument for ascertaining the pressure of gas, generally consisting of a bent graduated tube containing water or mercury, open at one end and with the other screwed into the vessel containing the

gas.
gas-globe (gas'glob), n. A globe of glass or porcelain used to shade a gas-light.
gas-governor (gas'guv'er-nor), n. 1. An apparatus, controlled by gas-pressure, which regulates the speed of a steam-engine driving a gas-exhauster, thus maintaining any required pressure or exhaust.—2. A device for regulating the flow of illuminating gas from a burner

and preventing waste.
Also called gas-regulator.

gas-gun (gas'gun), n. A pipe in which gases are exploded for signaling purposes.

gas-holder (gas hol'der), n. A vessel for the storage of gas after purification, and for regulating its flow through street-mains, burners,

lating its flow through street-mains, burners, etc. See cut under gasometer.

gash-wein (gash'vān), n. In mining, a fissure containing veinstone or ore, or both intermixed, which does not extend downward or upward into another formation or group of strata. A gash appears usually to be the result of a shrinkage, or of some alight tension of the rock in which it occurs. Fissure, as used in the term fissure-vein, means a crack which has a deep-seated cause, and which therefore may be expected to extend downward or upward, regardless of any change in the formation. (See fissure-vein.) The lead-bearing crevices of the upper hississipplie and region are gashiveins. They do not pass out of the galeniferous dolomite into the underlying blue limestone, or into the overlying shales of the Hudson River group.

gasification (gas'i-fi-kā'shon), n. [As gasify + -atton. Cf. F. gaseification.] The act or process of converting a substance into gas, or producing gas from it.

gasiform (gas'i-form), a. [< gas + L. forma,

ducing gas from it.
gasiform (gas'i-fôrm), a. [\(\) gas + L. forma,

Sterne, Tristram Shandy, v. 215.

as-holder (gas'hōl'dèr), n. A vessel for the itorage of gas after purification, and for reguating its flow through street-mains, burners, etc. See cut under gasometer.

ash-vein (gash'vān), n. In mining, a fissure containing veinstone or ore, or both intermixed. which does not extend downward or up-mixed. which does not extend downward or up-mixed.

gas-meter (gas'mē'ter), n. An apparatus through which illuminating gas is made to pass, in order to ascertain the number of cubic feet in order to ascertain the number of cubic feet of it produced at gas-works or consumed by those supplied with it. Of this apparatus there are two types, the wet and the dry, the former being now principally used for measuring the quantity produced, and the latter, on a much smaller scale, the quantity produced, and the latter, on a much smaller scale, the quantity produced, and the latter, on a much smaller scale, the quantity produced, and the latter, on a much smaller scale, the quantity produced, and the latter, on a much smaller scale, the quantity of goar which is admitted through a pipe in the center of the meter, and, owing to the arrangement of the partitions of the chambers, causes the drum to maintain a constant revolution. This sets in motion a train of wheels carrying the hands over the dials which mark the quantity of gas passing. The dry meter consists of two or three chambers, each divided by a flexible partition or diaphragm, by the motion of which the capacity on one side is diminished, while that on the other is increased. By means of silde-valves, like those of a steamengine, worked by the movement of the diaphragms, the gas to be measured passes alternately in and out of each space. The contractions and expansions set in motion the clockwork which marks the rate of consumption. The diaphragms in all the chambers are so connected that they move in concert.

nect, preserve, or mix different gases. (b) An instrument for measuring the quantity of gas employed in any chemical experiment.—2. A reservoir or storehouse for gas, especially for the ordinary illuminating gas produced in gasworks, which supplies the various pipes employed in lighting streets and houses. The main part of the structure is a cylindrical gas-holder, formed of riveted sheet-iron plates braced internally, closed at the

upper end, and resting at the open lower end in a masonry or brickwork water-tank of corresponding form, in which it rises or falls according to the amount of gas passing into rout of it. The holder (often more than 100 feet in diameter, and sometimes made in telescoping sections) is suspended from a heavy framework by chains passing over pended from a heavy framework by chains passing over weights, which aid in regulating the pressure. The name gas-holder is often used for the whole structure, as more appropriate than gasometer, since it is not in any sense a gas-works with all that the structure and supply of case; a gas-works with all that the structure and supply of case; a gas-works with all that the structure and supply of case; a gas-works with all that

gasometric (gas-ō-met'rik), a. [As gasometer +-ic.] Of or pertaining to gasometry or the measurement of gases.—Gasometric analysis, in chem., the process of separating and estimating the relative proportions of the constituents of a gaseous body. This is effected either by the action of absorbents, as on gas contained in a eudiometer, or by exploding the gas with oxygen and observing the volumes before and after explosion.

gasometry (gas-om'e-tri), n. [= F. gazometrie = Sp. gasometria = Pg. gazometria; as gasome-ter + -y.] The science, art, or practice of measuring gases.

gasoscope (gas'ō-skōp), n. [⟨ gas + Gr. σκοπεῖν, view.] An instrument for indicating the presence of gas in buildings, mines, etc.

establishment or "plant" for the manufacture and supply of gas; a gas-works with all the necessary adjuncts, as street-mains, offices, etc. gas-plate (gas'plāt), n. A slightly hollowed hardened steel disk set in the face of the slid-

hardened steel disk set in the face of the slid-ing-block of the Krupp breech-mechanism to receive the direct force of the powder-gases. gas-plot (gas'plot), n. In theaters, a diagram prepared by the gas-engineer for each act in a play, upon which is plotted a plan of the scene, with the positions of all pockets and lights, the names of the men stationed at them, and a memorandum of the duties and cues of each.
gas-pore (gas'pōr), n. A cavity in a mineral
containing gas-bubbles. Sorby. See inclusion.
gas-port (gas'pōrt), n. A port used in the management of gas, as "plugs" and hydrants are
used for water.

Around natural gas-ports grass has been green all winas in summer.

New York Semi-weekly Tribune, March 11, 1887.

gas-purifier (gas 'pū'ri-fi-èr), n. In gas-making, an apparatus for freeing the gas from sulphur compounds, and through which the gas is caused to flow as it comes from the gas-washer or scrubber. One form is the wet-lime purifer, in which the gas traverses a number of chambers partially filled with a creamy mixture of lime and water, through which it bubbles. In the dry-lime purifer moistened hydrate of lime is placed on fron trays, through which the gas is filtered. In other purifiers hydrated sesquioxid of iron and other materials are substituted for the lime. After the action of the purifier, the gas is ready for use.

gas-range (gas'rānj), n. A cooking-stove or range in which gas is used as fuel.

gas-register (gas'rej'is-tèr), n. An apparatus for recording the pressure of gas. It is a cylinder covered with paper, and made to revolve by clockwork. Time is indicated by vertical graduations on the paper, while the pressure of the gas in the mains controls a pencil, the point of which rests against the cylinder, and records in a rising and falling line the changes in pressure.

gas-regulator (gas'reg'ū-lā-tor), n. Same as to flow as it comes from the gas-washer or

gas-retort (gas'rē-tôrt'), n. A chamber in which carbonaceous matter is distilled to produce illuminating gas.

duce illuminating gas.

gas-ring (gas'ring), n. In some forms of breechloading firearms, a gas-check consisting of a
thin steel or copper plate perforated to the
exact size of the caliber of the gun, and serving as a face-plate to the breech-block. The
chamber of the breech-block is larger than the hole in the
plate, so that when a charge explodes in the gun the gas
from the explosion flies back into the chamber, forcing
the plate or ring forward against the breech of the gun.

gas-sand (gas'sand), n. Sandstone yielding natural gas. The various beds of sandstone in the gas and petroleum region of Pennsylvania are frequently called

Gasserian (ga-sē'ri-an), a. Of or pertaining to the German physician Gasserius (1505-77): as, the Gasserian ganglion, often mistakenly called the Casserian. See ganglion.

gassing (gas'ing), n. [Verbal n. of gas, v.] 1.

The process of singeing lace, cotton, yarn, etc., to remove the hairy filaments.

The gassing or singeing, in which process the [silk] yarn run continually through a gas flame at a speed carefully guilated so that the flame shall burn off the loose flaenests.

Harper's Mag., LXXI. 250.

2. The act or practice of talking in an idle, empty manner; talking nonsense. [Slang.] gassing-frame (gas'ing-fram), n. An apparatus in which yarns are run off from one bobbin to another and carried through gas-flames in the operation of gassing. A stop-motion is used to draw the yarn out of the flame in case it knots and stops, and thus prevent it from burning off.

and thus prevent it from burning off.

Gasslot's cascade (gas'i-ots kas-kād'). An electrical discharge having the appearance of a cascade passing over the surface of a cup or beaker placed within the receiver of an airpump.

gassoul (ga-söl'), n. [Morocco.] A mineral soap exported in considerable quantities from

gas-stove (gas'stov), n. An apparatus for utilizing coal-gas, water-gas, or the vapor of gasolene in heating and cooking, by means of small jets. Large gas-stoves are sometimes called

2. Given to "gas" or "gassing"; prone to conceited, boastful, or high-flown talk: as, a gassy fellow. [Slang.]

Gasterocoma (gas-te-rok'ō-mā), n. [NL. (Goldfuss, 1829), < Gr. γαστήρ, stomach, + κόμη, hair.]

The typical genus of the family Gasterocomidæ.

Gasterocomidæ (gas' te-rō-kom'i-dē), n. pl.

[NL., < Gasterocoma + -idæ.] A family of encrinites or fossil crinoids, found in the Devonian rocks.

Gasterolichenes (gas'te-rō-li-kē'nēz), n. pl. [NL., < Gr. γαστήρ, stomach, + λειχήν, lichen.] A small group of plants having algal gonidia and fungal hyphæ which form a peridium, and produce spores in the same manner as the Gaste-

duce spores in the same manner as the Gasteromycetes, especially of Lycoperdon. Two genera and three species are known.

Gasteromycetes (gas'te-rō-mī-sō'tēz), n. pl.

[NL., ⟨Gr. γαστήρ, stomach, + μύκης, pl. μύκητες, mushroom.] In mycology, one of the principal divisions of the Basidiomycetes, characterized by horizonth hymosium inclosed lining small by having the hymenium inclosed, lining small cavities, which are formed within a peridium. The principal genera are Geaster (earth-star) and Lycoperdon (puffball). Some species of the latter attain a large size. See cut under exoperidium. gasteromycetous (gas'te-rō-mī-sē'tus), a. Belonging to or having the characters of Gastero-

mycetes.

Gasteropegmata (gas'te-rō-peg'ma-tā), n. pl.

[NL., ζ Gr. γαστήρ, stomach, + πῆγμα, a thing fastened, a frame: see pegm.] A division or suborder of lyopomatous brachiopods, characterized by the attachment to foreign substances of the ventral valve, proposed for the family Granide. Craniida

Gasterophilus, Gastrophilus (gas-te-rof'-, gas Gasterophilus, Gastrophilus (gas-te-rof'-, gas-trof'i-lus), n. [NL., < Gr. γαστήρ, stomach, + φίλος, loving.] A leading genus of dipterous insects, of the family Œstridæ, or bot-flies, several species of which infest the horse and ass. G. equs is the common bot-fly of the horse, which lays its eggs on the skin, whence they are transferred to the stomach by the animal in licking itself, there to hatch into the larves or grubs known as bots, which are passed per anum and become mature flies in dung or earth. Also Gastrus. See cut under bot-fly.

gasteropod, gastropod (gas'te-rō-pod, gas'trō-pod), n. and a. [< NL. gasteropus, gastropus (-pod-): see gasteropodous.] I. n. A gastropodous mollusk; any one of the Gasteropoda.

gasteropod, gastropodo (gas te-ro-pod, gas tropodous mollusk; any one of the Gasteropoda.

H. a. Gastropodous.
Also gasteropodan, gastropodan.

Gasteropods, Gastropoda (gas-te-rop'ō-dä, gas-trop'ō-dä), n. pl. [NL. (Cuvier, 1798), neut. pl. of gasteropus, gastropus (-pod-): see gasteropodous.] A group of mollusks to which different values and limits have been assigned.

(a) Originally it was considered by some as a section and by others as an order of the mollusks, which were then ranked as a class. Later it was raised to a class and almost universally accepted as such. (1) It has generally been customary to include in it all the mollusks with a distinct head, and foot developed from the abdominal surface, thus contrasted with the classes Cephalopoda and Pteropoda. (2) By many it has been extended to include all having a head, thus embracing the Pteropoda and excluding only the Cephalopoda. (3) By others it has been restricted to those having a distinct head, abdominal foot, and a spiral, subspiral, or low oval or conic shell or naked body, and a more or less asymmetrical arrangement of the internal organs, the Chitonidae and some naked for naked body, and a more or less asymmetrical arrangement of the internal organs, the Chitonidae and some naked conic form wound round in a spiral coll, but varying from a very high turreted from to a discold or even sunken spire, an intermediate stage being the most common; in various types it is of a broad conic form wound round in a spiral coll, but varying from a very high turreted form to a discold or even sunken spire, an intermediate stage being the most common; in various types it is of a broad conic form wound round in a spiral coll, but varying from a very high turreted from the foot of the animal; but in most of the land, shells (Pulmonifera) it is wanting, one of the shell is developed from the foot of the animal; but in most of the land, shells (Pulmonifera) it is wanting, one of the shell is developed from the foot of the

Gasteropteridæ, Gastropteridæ (gas'te-rop-, gas-trop-ter'i-dē), n. pl. [NL. (Swainson, 1840). Gasteropteron + -idæ.] A family of tectibranchiate gastropods, typified by the genus Gas-

chiate gastropods, typified by the genus Gasteropteron. The animal has very wide expanded epipodia or lateral swimming-lobes, a cephalic disk without tentacles, and the radula without central teeth, but with large pectinated lateral teeth and numerous aculeate marginal ones. The shell is internal, small, and nautiliform or patulous. Between 20 and 30 species are known.

Gasteropteron, Gastropteron (gas-te-rop'-, gas-trop'te-ron), n. [NL. (Meckel, 1813), (Gr. yaor $\eta\rho$, stomach, + $\pi\tau\epsilon\rho v$, wing.] A notable genus of tectibranchiate gastropods, typical of the family Gasteropteridæ. The visceral ganglia are in three pairs, right and left; and the esophageal ring has a pair of cerebral and a pair of pedal ganglia, with six visceral ganglia. The form was at first supposed to be a pteropod.

Gasteropterophora (gas-te-rop-te-rof'ō-rā), n. pl. [NL., < Gr. γαστήρ, stomach, + πτερόν, wing, + -φορος, < φέρειν = Ε. bear¹.] In J. E. Gray's classification (1821), the third class of mollusks, corresponding to the order Heteropoda of Lamarck, or Nucleobranchiata of De Blainville; the heteropods: regarded by others as an order of gastropods

Biainville; the neteropods: regarded by others as an order of gastropods.

Gasteropterygii, Gastropterygii (gas-te-rop-gas-trop-te-rij'i-i), $n.\ pl.\ [NL., < Gr.\ \rangle a \sigma \tau \eta \rho$, stomach, $+\pi \tau \ell p \nu \ell$ ($\pi \tau \epsilon p \nu \gamma$ -), wing.] In ichth., an order of fishes, the same as Malacopterygii abdominales. Goldfuss, 1820.

gasterosteid (gas-te-ros'tē-id), $n.\ A$ fish of the family Gasterosteidæ; a stickleback.

Gasterosteidæ (gas'te-ros-tê'i-dê), n. pl. [NL., Gasterosteidæ (gas'te-ros-tê'i-dê), n. pl. [NL., Gasterosteus + -idæ.] A family of hemibranchiate fishes, with a more or less fusiform body, conic or moderately produced snout, sides naked or with a row of bony shields, and the ventral fins subthoracic and composed of a large tral fins subthoracic and composed of a large spine and one ray. About 20 species are known, which all share collectively the name stickleback, but exhibit differences inducing naturalists to divide them into from 2 to 5 genera, the best known of which are Gasterosteus, including the largest fresh-water 2-spined species; Psycosteus, containing the many-spined species, with 6 to 10 spines; and Spinachia, represented by a marine species, the longest and largest of the family, with 15 spines, known as the sea-stickleback, etc. See stickleback. gasterosteiform (gas-te-ros'tē-i-fôrm), a. [See Gasterosteiformes.] Having the characters of the Gasterosteidæ; pertaining to the Gasterosteiformes.

Gasterosteiformes (gas-te-ros'tē-i-fôr'mēz), n. In Ginther's system of classification, the twelfth division of Acanthopterygii, having the spinous dorsal fin, if present, composed of separate spines, and the ventral fins subabdominal in consequence of the prolongation of the pu-bic bones, which are attached to the humeral

Gasterosteinæ (gas-te-ros-tē-ī'nē), n. pl. [NL., Gasterosteus + -inæ.] The typical subfamily of Gasterosteidæ, containing the 2-spined and 6- to 10-spined sticklebacks, with rounded snout, and the pelvic bones forming a triangu-lar area between the ventral fins. By some it is extended to include all the species of the

family Gasterosteide.

gasterosteoid (gas-te-ros'tē-oid), a. and n. I.
a. Pertaining to or having the characters of the
Gasterosteide or Gasterosteoidea.

II. n. A fish of the family Gasterosteidæ; a gasterosteid or stickleback.

Gasterosteus (gas-te-ros'tē-us), n. [NL., ζ Gr. γαστήρ, stomach, + ὁστέον, a bone.] The typical genus of the family Gasterosteidæ, by some extended to include all the species of that family, but by others restricted to the short species with pelvic bones forming a triangular plate, and two dorsal spines, as G. aculeatus: so called from the extension of the pubic bones along the ventral aspect of the fish, making the belly bony. See stickleback.

gasterotheca (gas'te-rō-thē'kā), n.; pl. gaste-rotheca (gas'te-rō-thē'kā), n.; pl. gaste-rotheca (-sō). [NL., ⟨Gr. γαστήρ, stomach, + θήκη, case: see theca.] In entom., the abdomencase, or that part of the integument of a pupa which covers the abdomen.

terothecal (gas'te-rō-thē'kal), a. [As gasterotheca + -al.] Sheathing or casing the abdomen, as the integument of a pupa.

Gastornis (gas-tôr'nis), n. [NL., < Gast(on), the Christian name of M. Planté, the discoverer, the Christian name of M. Planté, the discoverer, + Gr. δρνις, a bird.] A genus of gigantic Eocene birds found in the conglomerate below the plastic clay of the Paris basin. G. parisiensis was about as large as an ostrich, and is believed to have been a ratite or struthious bird, though referred to the Anatidæ by A. Milne-Edwards. The Distryma gigantes of Cope, from the Eocene of New Mexico, is referred to the genus Gastornis by Coues. G. minor and G. edwards are other species recently discovered at Rheims in France. The additional material shows a remarkable character in the permanence of the cranial sutures, usually obliterated in adult birds.

Gastornithes (gas-tôr'ni-thēz), n. pl. pl. of Gastornis, q. v.] A supposed order of birds, established for the reception of the fossil genus Gastornis.

gastorrhea, gastorrhea (gas-tō-rē'š), n. Contracted forms of gastrorrhea, gastrorrhea.

Gastracantha (gas-tra-kan'thš), n. [NL. (Latreille, 1833), as Gasteracantha, < Gr. γαστήρ $(\gamma a \sigma \tau \rho^{-})$, stomach, + $\delta k \alpha \nu \delta a$, spine.] A genus of orbitelarian spiders, giving name to a family Gastracanthida: so called from the enormous horns into which the sides of the abdomen are prolonged. gastræa (gas-trē'ā), n.; pl. gastrææ (-ē).
[NL., 〈 Gr. γαστήρ (γαστρ-), stomach.] In biol., a hypothetical animal form assumed by Haeckel as the ancestor of all metazoic animals—that is, of those which pass through or attain — that is, of those which pass through or attain to the morphological form of a gastrula. See gastrula. It is a supposed primeval intestinal animal of the form-value of a gastrula (palingenetic archigastrula) or germ-cup, consisting of two germ-layers or blastodermic membranes, ectoderm and endoderm, the latter inclosing a visceral cavity or archenteron, and being itself inclosed in the ectoderm, and having a protostoma or primitive blastoporic communication with the exterior. In its simplest expression, a gastræa or gastrula represents a hollow sphere, or rather an hour-glass figure, with one half of it pushed into the other half, so that it makes a two-layered cup with a contracted opening. [As gastrostege + -al.] Covering the belly, as the ventral scutes of a snake; pertaining to the gas-

gastrostege (gas'trō-stēi). n. (yaorp-), stomach, + ortyoc, a roof.] One of the scales or scutes which cover the abdomen of a snake from the head to the tail; an abdominal scute or scutellum. Snakes seldom have on the belly many small scales like those of the back and sides, being usually furnished instead with short, wide, transverse gastrosteges which reach from side to side, and are imbricated, the hind edge of one overlapping the fore edge of the next succeeding. By muscular action when the snake is wriggling the whole series of gastrosteges stand somewhat on edge, so that their sharp hind borders catch on the slightest inequality of the surface, over which the snake thus glides as if pushed along by numberless little feet. That such is the action of the gastrosteges may be inferred from the ineffectual writhing of a snake when placed on a perfectly smooth surface, as a plate of glass. The last gastrostege, technically called the preamal or postabdominal, is usually bifid, or otherwise modified. Scutes somewhat like gastrosteges cover the under side of the tail, and are known as urosteges. B, longitudinal section through the axis: g, primitive intestine (primitive intestinal cavity): o, blastopore or primitive mouth-opening): i, inner cell-layer of the body-wall (the inner germ-layer, hypoblast, endoderm, or intestinal layer): c, outer cell-layer (the outer germ-layer, ppiblast, ectoderm, or skin-layer). (From Haeckel's "Evolution of Man.")

It is the result of that process of invagination which occurs in most animals, whereby a vesicular morula, blastosphere, or blastula is converted into a cup-like two-layered germ, with a blastopore or orifice of invagination, and an endoderm or membrane inclosing a primitive intestinal cavity, the endoderm itself being inclosed within an ectoderm. The word enters into many loose compounds of obvious meaning, as gastrula-body, -cup, -form, -formation, -germ, -mouth, -stage, -stomach, -tc., mostly derived from the translation of the German compounds used in Haeckel's works. See gastrulation.

1. A glove; specifically, in medieval armor, a glove of de-

of deglove fense, either attached to the defensive ar-mor of the arm or sepa-rate from it. rate from it. Throughout the twelfth and thirtwelfth and thir-teenth centuries the sleeve of the hauberk was long, and closed at the end covering the hands in the form of mittens; a

end covering the hands in the form of mittens; a glove of leather was worn beneath the mail to protect the hand from the chafing of the metal rings. To-ward the end of the thirteenth century a slit was made at the palm, through which the hand could be passed, allowing the mail mitten to hang from the wrist. A few instances of mail gauntlets with separated fingers appear in English monuments of the same period. In the fourteenth century the separate armed glove appears, consisting at first of leather upon which roundels and other plates of steel are sewed; and about 1350 is found the completely articulated glove of hammered steel, each finger separate and each joint free to bend. The changes after this are merely in the direction of greater delicacy of execution, allowing still freer movement. In tourneys and justs the left hand was sometimes guarded by a heavy steel glove without joints. See main-de-fer. Also called glove-of-mail.

A kind of East Indian ox long since domesticated from the wild stock of the gaur, and recognized by some naturalists as a different species called Bibos frontalis. It has a moderate hump, no dewlap, but wrinkled akin on the neck, a short tail, and comparatively alender horns. The color is brownish, with white "stockings" on all the legs. It crosses with the common Indian bull. Much confusion has arisen from misunderstanding of the relation of the gaurs and gayal, these names being often interchanged. Gayals are simply the domesticated descendants of gaurs, now owned by various Indian tribes from Assam to Aracan along the eastern frontier of the Indian peninsula, and are never

found in the wild state. Little use is made of them, how-ever, and they spend the day in the jungles, returning to their owners in the villages at night.

Mr. Sclater observed that . . the fact that the gapal was owhere found in the wild state was quite new to him.

gazogene (gaz'ō-jēn), n. [< F. gazogène, < gaz,

= E. gas, + Gr.-yev/c, producing: see-gen, -gene.]

An apparatus used for manufacturing aërated water on a small scale for domestic use, by the action of an acid on an alkali carbonate. It generally consists of two globes, one above the other, connected by a tube, the lower containing water, and the upper the ingredients for producing the aerated liquid. When water is gently introduced into the upper globe from the lower, by inclining the vessel so as to about half fill it, chemical action takes place, and the carbonic acid descends and gradually saturates the water in the lower globe. When this has taken place, the aërated water can be drawn off by opening a stop-cock at the top. Also spelled gasogene.

Tennyson, The Revenge.

Overhead gear, driving-gear above the object driven.

—Rope driving-gear, ropes used as a substitute for belting in the transmission of power from a driver to machinery.—Running-gear, the running-rigging of a vessel. (For other kinds of gear, see bevel-gear, cone-gear, counter-gear, etc.)

gear (ger), v. [< gear, n.] I. trans. To put into gear; prepare for operation; fit with gear or gearing: as, to gear up a wagon; to gear a machine or an engine.—Geared brace, engine, etc. See the nouns.

II intrans. In mach, to fit into another part as one part of gearing into another. See gearing. On the shaft of the motor . . . is a pinion. This gears with a larger cog wheel. Sci. Amer., N. S., LVII. 308.

gear-box (ger'boks), *. A box inclosing gearing to protect it.

The effect of the same amount of resistance on each wheel will become unequally operative in the gear-box, and that defeats the whole object of the contrivance and that defeats the whole object of the contrivance.

Bury and Hillier, Cycling, p. 385.

gear-cutter (ger'kut'er), n. One who or that which makes toothed or geared wheels for transmitting motion in machinery; specifical-ly, a machine for cutting the teeth of a geared wheel. Gear-outers are frequently orinding machine eel. Gear-cutters are frequently grinding-machines, mery-wheel being used to cut away the superfluous

material between the cogs or teeth, the shape of the emerywheel determining the shape of the interdental space, and consequently determining the shape of the teeth. Milling-cutters are also much used. Gear-cutting machines usually have the shape of a lathe, the blank being supported on the mandrel, and the cutting wheel by the tool-rest. The number and pitch of the teeth are regulated by a graduated disk sitached to the mandrel, and the cutter is driven by various systems of gearing. Large machines have been made to work as planers, and arranged for every variety of angle and level gearing. Wood-working gear-cutters are rotary outters (molders), and are used to cut wooden patterns for casting geared wheels. Gear-cutters are also made to cut whoels of epicycloidal form. A gear-cutting attachment is also used with some milling-machines. See odentograph.

gearing (gering), n. [Verbal n. of gear, v.]

1. Gear; dress; harness.—2. In mach., the parts collectively by which motion communicated to one part of a machine is transmitted to another; specifically, a train of toothed wheels for transmitting motion. There are two chief sorts of toothed gearing, namely, spur-gearing and beseled gearing. In the former the teeth are arranged round either the concave or the convex surface of a cylindrical wheel in the direction of radii from the center of the wheel, and are of equal depth throughout. In beveled gearing the teeth are placed upon the exterior periphery of a conical wheel in a direction converging to the spec of the cone, and the depth of the tooth gradually diminishes from the base. See bevel, and cut under bevel-gear.—Angular gearing. See angular.—Beveled gearing, seed wheels of an elliptical shape, used to obtain a rotary motion of variable speed: also called elliptical wheel.—Hooke gearing, s form of gearing having the teeth set somewhat obliquely across the face of the wheel, so that the contact of each tooth begins at its forward end and ceases at the opposite end. The spiral has such a pitch that one pair of t

gear-wheel (ger'hwel), n. Any wheel having
teeth or cogs which act upon the teeth of another wheel to impart or transmit motion.—
Annular gear-wheel. See annular.—Double gearwheel, a wheel having two sets of cogs, differing in diameter, to drive two pinions. Such a wheel sometimes is
driven by one pinion and drives the other.

Gecconidæ (ge-kon'idē), n. pl. [NL., \ Gecconidæ, no postorbital or frontosquamosal arches, dilated clavicles loop-shaped proximally, a short, thick, fleshy, papillose geongue, large eyes with vertical elliptical pupils and rudimentary lida, and pleurodont dentition. The body is covered below with small imbricated scales: the tall is normally long and tapering; and the limbs are stout and of moderate length, with well-developed toes and claws, usually furnished with adhesive disks, secreting an acrid though not poisonous fluid. Upward of 200 species inhabit the warmer parts of both hemisphere; many were formerly placed indiscriminately in a genus Gecco or Gecko; but about 50 genera have been named, among which are Diplodactylus, Hemidactylus, Phyllural, Phyllodactylus, Theadactylus, Phyllurus, and Ptychozoön. They are all inot fensive lizards of small size, from 2 or 3 to 12 or 14 inches long, of active carnivorous habits, and specially noted for the agility with which they scramble over walls, etc. Many of them make a croaking or chirping noise, whence the name gecko. A few are found in the south of Europe, as the common wall-lizard, Platydactylus muralis; the tarente, P. mauridancus; and the Hemidactylus verruculatus and Stenodactylus guttatus. I. n. A concrete animal substance, transparent, herd end tactalese which swells without so. hard, and tasteless, which swells without so hard, and tasteless, which awells without solution in cold water, dissolves in warm water and in acetic acid, and is insoluble in alcohol or ether. Gelatin does not exist as such in the animal tissues, but is formed by the action of boiling water on connective tissues, cartilage, ligaments, and tendons, as well as on skin, horn, fish-scales, etc. The coarser form of gelatin from hoofs, hides, etc., is called glue; that from skin and finer membranes is called rize; and the purest gelatin, from the air-bladders and other membranes of fish, is called tinglass. Its leading character is the formation of a tremulous jelly when its solution in boiling water cools. A yellowish-white precipitate is thrown down from a solution of gelatin by tannin, which forms an elastic adhesive mass. Tannin has the same action also on the tissues from which gelatin is made, and this action of tannin is the foundation of the art of tanning leather. Gelatin is nearly related to the proteids. It is regarded as a nutritious food, and much used in preparing soups, jelles, etc.; but animals fed exclusively on it die with the symptoms of starvation. No chemical formula has yet been deduced for gelatin. It contains about 18.3 per cent. of nitrogen, 0.6 per cent. of sulphur, 50 of carbon, 7 of hydrogen, and 23 of oxygen. (See jelly.) In all the arts allied to photography, gelatin forms the basis of a great variety of processes. ly small in comparison with the size of the parent.

Gemmation consists in the production of a bud or buds, of an animal; which buds become developed into more or less completely independent beings. The fresh beings thus produced by budding are all known as zoolds. . . When the zoolds produced by budding remain permanently attached to one another and to the parent organism which produced them, the case is said to be one of "continuous" gemmation, and the ultimate result of this is to produce a colony or composite structure, composed of a number of similar and partially independent beings, all produced by budding, but all remaining in organic connection.

3. In gram., a formal distinction in words, apparently founded on and in part expressing differences of sexual character, as male and female, or as male, female, or of neither sex male, or as male, female, or of neither sex (neuter). In the languages of the Indo-European family the distinction originally is threefold, as masculine, feminine, and neuter (the first including principally male beings, the second female, and the third those of no sex), and appears in nouns, adjectives, and pronouns (except the personal pronouns), although among masculines and feminines are included (on grounds not yet made clear) many words designating things of no sex. In the Senitic languages the genders are only two, masculine and feminine, and the distinction is made also in the second and third persons of verbs. In the majority of languages distinction of gender is altogether wanting. In some tongues differences not of sex are made the ground of formal distinc-

tions also called by some by the name gender: thus, that of animate and inanimate objects in American languages; a manifold distinction (of obscure origin) in South African languages, and so on. Some languages, like the modern French, have lost the neuter gender, and have masculine and feminine only; some, like English, have no gender except in a few pronouns, as he, she, it; some, like modern Persian, have no gender whatever.

3. Milit., an officer holding a general command (whence the title); the commander of an army, or of any organization of troops larger than a regiment: as an official title, used either alone for the highest or next to the highest rank, alone for the highest or next to the highest rank, or with an adjunct designating the particular grade. See lieutenant-general, major-general, and brigadier-general. In modern European armies the specific rank of general is usually the highest under that of marshal or field-marshal. In the United States the title, when used, is that of the acting commander-in-chief of the whole army (the President being the titular commander-in-chief). The rank has been held, under temporary laws, only by Generals Washington, Grant, and Sherman, and for a short time before his death in 1883 by General Sheridan, whose previous title as commander-in-chief was lieutenant-general. In address and common speech any general officer is called general simply. Abbreviated Gen.

generalization (jen'e-ral-i-za'shon), n. [= F. généralisation = Sp. generalizacion; as generalize + -ation.] 1. The act of generalizing; recognition of a character as being common to two or more objects; also, the process of forming a general notion.

Although, for example, we had never seen but one rose, we might still have been able to attend to its colour, without thinking of its other properties. This has led some philosophers to suppose that another faculty besides abstraction, to which they have given the name of generalization, is necessary to account for the formation of genera and species.

D. Stewart, Elements, iv. § 1.

2. Induction; an inference from the pos sion of a character by each individual or by some of the individuals of a class to its posses-sion by all the individuals of that class; the observation that the known individuals of a species, or the known species of a genus, have generalizer (jen'e-ral-I-zer), n. O a character in common, and the consequent ata character in common, and the consequent at-tribution of that character to the whole class; also, a conclusion so reached.

In our inquiries into the nature of the inductive process, we must not confine our notice to such generalizations from experience as profess to be universally true.

J. S. Mui, Logic, III. XIII. 9 1.

When we have proved with respect to the circle that a straight line cannot meet it in more than two points, and when the same thing has been successively proved of the ellipse, the parabola, and the hyperbola, it may be laid down as a universal property of the sections of the cone. J. S. Muil, Logic, III. 11, § 2.

I am not going to attempt a definition of the Anglo-Saxon element in English literature, for generalizations are apt to be as dangerous as they are tempting.

3. In math., the process or result of modifying a proposition so as to obtain another having wider subject and predicate, but such that a 3. In math., the process or result of modifying a proposition so as to obtain another having wider subject and predicate, but such that a limitation which, if applied to the new subject, gives the old subject, will reproduce the old predicate when applied to the new. For example, Fermat's theorem is that if ρ is any positive prime number and a any number not divisible by ρ , then the division of $a^{\rho-1}$ by ρ leaves 1 as the remainder. A generalization of this is, that if k is any positive integer, and ϕk the number of numbers as small as k and prime to it, and as any number relatively prime to k, then the division of $a^{\phi k}$ by k leaves 1 as the remainder; for when k is a prime number, $\phi k = k - 1$, and every number not divisible by k is prime to it. The language of mathematics differs from that of logic in that from every generalization of a proposition the proposition tielf is immediately deducible, which is not true in the logicians sense of the word. The distinction between generalization and extension in mathematical language is not very clear, but the latter term applies primarily to a conception or function which has received a new and wider definition; also, the modification of a proposition concerning two dimensions so as to make it apply to three is called an extension.

We are next to consider the operations of the understanding, by which we are enabled to form general conceptions. These appear to me to have three:—First, The resolving or analyzing a subject into its known attributes, and giving a name to each attribute, which name shall signify that attribute, and nothing more. Secondly, The observing one or more such attributes to be common to many subjects. The first is by philosophers called abstraction; the second may be called generalizing; but both are commonly included under the name of abstraction.

Reid, Intellectual Powers (1786), p. 445.

1. The act, process, or function of generating or begetting; procreation; propagation; reproduction; multiplication of kind. The modes of generation in the animal kingdom are reducible to four leading types: (1) fission, (2) sporation, (3) genmation, and (4) sexual generation. (See these words, and conjugation.) Another division is into sexual or gamic generation, which prevails in all the higher animals and in most others, and asexual or non-sexual or agamic generation. Many variations in the mode of generation, chiefly sexual, are expressed by such terms as fissiparous, genmiparous, larviparous, oviparous, ovorviparous, pupiparous, inviparous. (See these words and the corresponding abstract nouns.) See genesis, 1.

The threads sometimes discovered in eels are perhaps their young: the generation of eels is very dark and mysterious.

White, Nat. Hist. of Selborne, xl.

2. In theol., the communication of the Divine 2. In theol., the communication of the Divine Essence from God the Father to God the Son. The catholic or orthodox Trinitarian doctrine is that God the Son is a distinct person, truly God and of the same essence as the Father, and is therefore existent in his own personality as the Son from all eternity to all eternity, and that the divine act of generation is accordingly itself eternal or without beginning and without end: in opposition to the Arian teaching, that "there was formerly a time when he [Christ] was not, and that before bein be gotten he was not." The person or hypostasis of God the Son being "the express image [or impress, xapaxrip] of his [God the Father's] person (wwforzass)" (Heb. i. 8.), the communication of essence is that of a father to a son, and is accordingly begetting or generation; whereas the communication of the Divine Essence to the Holy Spirit is simply procession.

The older geneses, whether of the world or of mind, are so simple and ultimate, have been rounded to such epic completeness and sublimity, that, as they are superseded by still larger and lottier conceptions, their dissolutive phases are often pathetic. Amer. Jour. Psychol., I. 156.

4. [cap.] The first book of the Old Testament. It records the creation of the world, the flood and the ensuing dispersion of races, and a more detailed history of the families of the Hebrew patriarchs Abraham, Isaac, and Jacob. The traditional and still widely prevalent view ascribes the authorship to Moses. Many modern scholars, however, find strong evidences of various periods of authorship, and particularly of two chief sources, the so-called Jehovistic and Elohistic. According to the latter view, the dates of composition fall chiefly within the period of the kingdoms of Judah and Israel (about the eighth century B. C.), the last redaction occurring perhaps after the return from Babylon. In Hebrew the book is designated by its first word, Breshith, 'In the beginning'; the title Genesis was supplied in the early Greek translation. Abbreviated Gen. See documentary hypothesis (under documentary), Elohistic, Jehovistic.

It. genitivo, \(L. genitivus, usually in classical L. spelled genetivus, of or belonging to birth; in grammar, with or without casus, the genitive case (a mistranslation of Gr. η γ νική πτῶσις, the generic or general case, γενικός meaning also belonging to the family, also to generation, $\langle \gamma \ell vo_5 = L. genus \rangle$, $\langle genitus, pp. of gignere, OL. genere, beget, produce: see genital, genus.] I. a. In gram., pertaining to or in$ dicating origin, source, possession, and the like: an epithet applied to a case in the declension of nouns, adjectives, pronouns, etc., which in English is called the possessive case, or to the relation expressed by such a case: as, patris, 'of a father, a father's,' is the genitive case of the Latin noun pater, a father.

II. n. In gram., a case in the declension of nouns, adjectives, pronouns, etc., expressing in the widest sense a relation of appurtenance between one thing and another, an adjectival relation of one noun to another, or more specifically source, origin, possession, and the like; in English grammar, the possessive case.

English grammar, the possessive case.

The Latin genitious is a mere blunder, for the Greek word genité could never mean genitious. . . . Genité in Greek had a much wider, a much more philosophical meaning. It meant casus generalis, the general case, or rather the case which expresses the genus or kind. This is the real power of the genitive. If I say, 'a bird of the water,' of the water defines the genus to which a certain bird belongs; it refers to the genus of water birds. 'Man of the mountains' means a mountaineer. In phrases such as 'son of the father' or 'father of the son,' the genitives have the same effect. They predicate something of the sons of the father, and if we distinguished between the sons of the father and the sons of the mother, the genitives would mark the class or genus to which the sons respectively belonged.

1. The ruling or predominant spirit of a place, person, or thing; the power, principle, or influence that determines character, conduct, or destiny (supposed by the ancients to be a tutelar divinity, a good spirit, or an evil demon, usually striving with an opposing spirit for the mastery); that which controls, guides, or aids: as, my good genius came to the rescue; his evil genius enticed him. [In this sense and the following the plural is genii.]

Some say, the Genius so

Some say, the Genius so
Cries, "Come!" to him that instantly must die.

Shak., T. and C., iv. 4.
The word genii hath by some writers been erroneously dopted for geniuses. Each is a plural of the same word enius, but in different senses. When genius in the sinular means a separate spirit or demon, good or bad, the dural is genii; when it means mental abilities, or a peron eminently possessed of these, the plural is geniuses.

2. A disembodied spirit regarded as affecting human beings in certain ways, but not as con-nected with any one individually.

The Abyasinians, to a man, are fearful of the night, unwilling to travel, and, above all, to fight in that season, when they imagine the world is in possession of certain genii, averse to intercourse with men.

Bruce, Source of the Nile, II. 26.

8. A type or symbol; a concrete representa-tive, as of an influence or a characteristic; a generic exemplification.

I do remember him at Clement's Inn, like a man made ter supper of a cheese-paring: he was the very ge-iss of famine. Shak., 2 Hen. IV., iii. 2.

A golden lizard — the very genius of desolate stillness — had stopped breathless upon the threshold of one cabin.

Bret Harte, Baby Sylvester (Tale of the Argonauts).

4. Prevailing spirit or inclination; distinguishing proclivity, bent, or tendency, as of a person, place, time, institution, etc.; special aptitude or intellectual quality; intrinsic characteristic or qualification: as, a genius for poetry, or for diplomacy; the genius of Christianity, of the Elizabethan period, of the American Constitution, of the Vatican.

Taking with him his two Sisters, he retired into a Mon-astery, they into a Nunnery. This does not suit with the Genius of an Englishman, who loves not to pull off his Clothes till he goes to bed. Howell, Letters, I. iii. 11.

Genius loci. [L.] The presiding divinity of a place; hence, the pervading spirit of a place or an institution, as of a college. See ded. I. = Syn. 5. Abilities, Gifts, Talents, Parts, Aptitude, Faculty, Capacity, Genius, Ingenuity, Cleverness, all indicate special or excellent power for doing work that is more or less intellectual. Dilities is the most general and common word for intellectual powers of the active sort, intellectual competence to do effective work; abilities are always either acquired or developed. (See ability.) Gifts are strictly endowments, or abilities regarded as conferred by the Creator. (See acquirement.) Talents comes to the same idea, its Biblical origin (Mat. xxv. 14-30) making the powers seem primarily intrusted to one for use, or at least given like money. Parts is regaining its former popularity and dignity, which it lost for a time; in the last century it stood for talents or gifts, excellent or superior endowments: as, he is a man of parts, or he is a man of good natural parts, the latter perhaps implying a failure to develop one's gifts. Aptitude is either natural bias or special fitness or skill; it may be native talent or disciplined ability. Faculty is cultivated aptitude, a highly trained power of doing something. The distinction between a faculty for and the faculty of should be noticed, the former being the kind of faculty now under consideration and the latter a bodily faculty, as the faculty of speech, hearing, etc. Capacity is receptive power: as, capacity to learn; it is a power of acquiring. "It is most remarkable in the different degrees of facility with which different men acquire a language." Sir J. Mackintosh. (See ability.) Genius is extraordinarily developed faculty, in many directions or in one; it is especially the creative power or original conceptions and combinations; it belongs with talents or gifts in s

The gentle (or gentler) sex, women collectively; womankind: opposed to the sterner sex.—Syn. 3 and 4. Gentle, Meek, Bland, Soft, Tame, Mid.; placid, dovelike, quiet, peaceful, pacific, moderate, clement, lenient, merciful, kind, indulgent; tractable, docile. Of the first six words, meet applies only to personal character and behavior; it is wholly good in the Bible, and now indicates a defect of character only occasionally by hyperbole. The others may be either physical or moral. The meaning of bland is founded upon the pleasant feeling of warm breezes, etc.; it suggests a peculiarly soothing impression, as a bland demeanor, or an artful endeavor to make such an impression. Soft suggests that which yields somewhat upon physical contact, and hence anything not making firm resistance or striking hard. As to animals, gentle refers to nature, being opposed to rough or færes, while tame is atme duck. Tame is used in a bad sense of spirit and of intellectual productions: as, a tame spirit; some very tame remarks. Mid goes further than gentle in expressing softness of nature; it is chiefly a word of nature or character, while gentle is chiefly a word of action. Mid is sometimes opposed to acrid, tart, etc.

names annexed to them, into genera and species, 1. e., into "kinds" and "sorts."

Locke, Human Understanding, II. xxxii. 6.

(b) In zoöl. and bot., a classificatory group ranking next above the species, containing a group of species (sometimes a single species) possessing certain structural characters different from those of any others. The value assigned to a genus is wholly arbitrary—that is, it is entirely a matter of opinion or current usage what characters shall be considered generic and thus constitute a genus; and genera are constantly modified and shifted by specialists, the tendency being mostly to restriction of genera, with the consequent multiplication of their number, and the coinage of new generic names. A genus has no natural, much less necessary, definition, its meaning being at best a matter of expert opinion; and the same is true of the species, family, order, class, etc. A genus of the animal kingdom in the time of Linnaeus and other early naturalists was a group of species approximately equivalent to a modern family, sometimes even to an order. Probably upward of 100,000 generic names of as many supposed genera have been coined or used in zoölogy; those in current use at present are estimated at about 60,000, or an average of about (rather more than) one genus for every five species in the animal kingdom. In botany the genera are less restricted and average a much larger number of species, the 9,000 phanerogamic genera, for example, including 100,000 species. The tenable name of any genus is that which has priority of publication, if it has been properly published and characterized, and is not the same as the prior name of some other genus. The names of the genus and the species together form the scientific name of an animal or a plant. In writing the technical name of an animal or a plant. In writing the technical name of an animal or genera constitutes a family or subfamily. The name of a genus as such has properly no plural. If a genus name, as for example Ada, is pluralized, as Adæ, it m

Almost every branch of physical and natural science is, or may be, called upon to throw light on the problems which present themselves to the geologist. Closely connected with geology, and indeed almost inseparable from it, is paleontology, or the study of ancient forms of life, since the rocks are found on examination to contain in many places remains of plants or animals, sometimes closely resembling, and often very different from, any now living on the earth. It is almost exclusively the order of succession of forms of life thus found which gives the geologist the means of making out a chronological arrangement for the different stratified formations. Geometridæ (jē-ō-met'ri-dē), n. pl. [NL., < Geometra + -idæ.] A large family of heterocerous lepidopterous insects or moths, named from the genus Geometra, whose larvæ are meafrom the genus Geometra, whose larvæ are measuring-worms; the geometers, geometrids, phalænida. This group, regarded as a family, is divided into 28 subfamilles, named Urapterina, Ennomina, Unochrominae, Amphidasinas, Boarmina, Encominas, Canchrominae, Amphidasinas, Boarmina, Endoninae, Geometrinae, Microcerinae, Palyadinae, Ephyrinae, Acidatinae, Mecocrinae, Caberinae, Macarinae, Fridoniniae, Hausinae, Zereninae, Liginae, Hyberninae, Larentiinae, Subolinae, Soninae, Hedylinae, Bratteiniae, Emplocinae, and Hypochrosinae. In some systems, as Guenée's, these are all elevated to the rank of families, ending in -idae, and the superfamily thus constituted, called Phalænites, is the Geometrina of English authors. The names Geometridae and Phalænidae are exactly synonymous; and the various names resulting from the changes in termination of the two words are applied to what is practically an identical group of moths, rated higher or lower in the taxonomic scale, according to the classificatory views of different authors. See the extract, and cuts under Cidaria and Haplodes.

and Haplodes.

The Geometridas or Phalamidae form a family of great size, being exceeded in numbers among the Lepidopters only by the noctuids and tineids, and probably equalled only by the pyralids and tortricids. They are . . . widely distributed over the globe, and the caterpillars of many species have proved very destructive to some of our most important vegetable productions. The moths have rather long, slender bodies, the thorax without tufts or crests. Ocelli are present in some species, and absent in others. The antennes are either simple, ciliated, or pectinated. The fore wings are large and triangular; the outer margin . . is nearly as long as the hinder margin. The hind wings are ample. . . In some [species], the females are wingless, or have only rudimentary wings, which are useless for flight. . . The caterpillars are slender and naked, usually with two pairs of abdominal legs, though rarely they have three or four pairs. This deficiency causes them to move along with a looping gait, and hence they are often called "measuring-worms," from which fact the family name [Geometridæ] was given.

See Euclidean geometry.—Descriptive geometry (invented by Gaspard Monge, 1794), the theory of making projections of any accurately defined figure such that from them can be deduced, not only its projective, but also its metrical properties. It is highly useful in engineering. The name is also applied to the theory of geometry in general treated by means of projections.—Elliptic geometry, system which assumes that space returns into itself, so that there are no points whose distance exceeds a certain finite distance.—Enumerative or denumerative geometry, the theory of the number of incidences and coincidences in a diagram drawn under given conditions.—Enclidean geometry, a system of geometry distance, and in the continum of three dimensions, that rigid bodies are capable of translation and rotation in all directions in every position, and that the sum of the three angles of a plane triangle is equal to two right angles.—Geometry of forces, the theory of congruencies and carnot, which traces the connection between the changes of position of an equation and the changes of position of a locus. (b) Modern projective geometry, commonly written in German Geometry of the compasses, a system of geometry of figures and restricted to a plane or other surface.—Geometry of the compasses, a system of geometry, the short projective geometry. Supplied of the distance from points at an imaginary distance.—Hinter geomet

geomorphy (jė 'ō-mòr-fi), 'n. [< Gr. γη, the earth, + μορφή, form.] The theory of the figure of the earth.

geomyid (jė-ōm'i-id), n. One of the Geomyidæ.

Geomyidæ (jė-ō-mī'i-dē), n. pl. [NL., < Geomys + -idæ.] A remarkable American family of myomorphic rodents; the pouched rats or pocket-gophers. They are characterized by the enormous external cheek-pouches lined with fur, not commous external cheek-pouches lined with fur, not com-

municating with the mouth, and extending in some cases along the neck as far as the shoulders; dental formula, 2 incisors in each upper and lower half-

perandlower half-jaw, no canines, 1 premolar and 8 molars in each up-per and lower half-jaw; fore feet fossorial, with large claws; tall short and stumpy; ears small, and general form ro-bust. The group corresponds othe Sciurospalacoides Sciurospalaeoides of Brandt or Geo-myinæ of Baird, and consists of the two genera Geo-mys and Thomo-mus. See gopher. gopher. mys. See gopher.

Of or pertaining to an important Teutonic race inhabiting central Europe, or to Germany, or to its inhabitants or their language. At the beginning of the Christian era the Germans occupied central Europe eastward to the Vistula, southward to the Carpathians and Danube, and westward to beyond the Rhine. Among their chief tribes were the Suevi, Lombards, Vandals, Heruli, Chatti, Quadi, Ubil, and Cherusci. After the epoch of migrations in the third and fourth centuries, many tribes, as the Franks, Burgundians, Lombards, and Vandals, settled permanently in other regions, and became merged in the new French, Italian, and Spanish nations. In the East the Germans were displaced by Slavs, although important parts of this region have since been Germanized. Since about the twelfth century the Germans have called themselves die Deutschen. In medieval and modern times they have occupied a region which has had many political changes, but which has remained of substantially the same extent for centuries. The former Roman-German empire contained various lands out inhabited by Germans dieval and modern times they have occupied a region which has had many political changes, but which has remained of substantially the same extent for centuries. The former Roman-German empire contained various lands not inhabited by Germans. At the present time the Germans form the great majority in the reconstituted German empire; they number over one fourth of the inhabitants of Austria-Hungary, chiefly in the western and northwestern parts; there are about 1,000,000 Germans in the Baltic provinces and elsewhere in Russia, and over two thirds of the Swiss are of German Raptists. germanium (jer-mā'ni-um), n. [NL., < L. Germania, Germany: see German.] Chemical symbol, Ge; specific gravity, 5.469; atomic weight, 72.3. An element discovered in 1885 by Winkler in the mineral argyrodite, which is a sulphid of germanium and silver. It is a metal of gray-white color and fine metallic luster, and crystallizes in octahedrons. It melts at about 900°C. It does not tarnish in air at ordinary temperature, is insoluble in hydrochloric acid, is oxidized by nitric acid, and dissolves in aqua regia. In the periodic system germanium takes the place of the hypothetical eka-silicium, between gallium and arsenic on the one hand and silicon and zinc on the other. Germanium is also said to be present in the mineral euxenite.

Germanization (jer'man-i-zā'shon), n. [< Germanize + -ation.] The act of Germanizing, or the state of being Germanized.

similar cells of a germinating organism; a cell resulting from segmentation of the vitellus; a blastomere.

The germ-cell assimilates the surrounding yolk, and propagates its kind by spontaneous fission, whence the first cell has been termed the primary germ-cell, and its progeny the derivative germ-cell. Brands and Cox.

germ-cup (jerm'kup), n. That germ-form of a germ which is a gastrula. See gastrula, and

germ which is a gastrula. See gastrula, and extract under germ-form.
germ-disease (jerm'di-zēz'), n. Any disease produced by a microscopic parasite or microbe.
germ-disk (jerm'disk), n. The germ-area of a germ when of a discoidal shape. In a mammal it is specifically the gastrodiscus of a gastrocystis; in other animals it is of a different morphological character, but is always the seat of specially active germination after the formation of the original blastoderm. Also called germinal disk.

germicide (jer'mi-sid), n. [< L. germ(en), a germ, + -cida, a killer, < cædere, kill.] That which destroys germs; specifically, a substance capable of killing the germs, microbes, or micro-organisms of certain zymotic diseases, as cholera, or used for that purpose.

cholers, or used for that purpose.

These accessions [of fever in whooping-cough] have always with them an increase in the germs of the disease;
... they are better lessened or prevented by whatever aids the resisting power of the child than by ... the use of special germicides. Quain, Med. Dict., p. 1774.

germiculture (jer'mi-kul-tūr), n. [< L. germ(en), a germ, + cultura, culture.] The artificial cultivation of the microscopical organisms (bacteria) connected with certain diseases.

See germ theory, under germ.
germiculturist (jer-mi-kul'tūr-ist), n. [< ger-miculture + -ist.] One who makes artificial cultures of germs, especially of bacteria; a bacteriologist.

The third point—the antiseptic value of these bodies—still remains for the germiculturist to determine.

Medical News, LII. 640.

germint, n. Same as germen, 2.

germinal (jer'mi-nal), a. [= F. germinal = Sp. Pg. germinal = It. germinale, < L. germen (germin-1), a sprout, offshoot, germ: see germ.] Pertaining to or constituting a germ; of the nature of a germ or of germination; germinative: as, germinal vesicles; germinal ideas or principles.

Those germinal ideas of making his mind tell upon the world at large . . . had been sprouting under cover.

George Eliot, Middlemarch, I. 393.

Germinal disk, a germ-disk.—Germinal epithelium. See *epithelium.*—Germinal membrane, a blastodermic

membrane or blastoderm; also, the cell-wall of an ovum.—Germinal pole, the central point from which development spreads in the ovum of some animals, as a bird or mammal; the pole of a germ-area. Quain.—Germinal spot, the nucleolus of a germ-cell or ovum. Also called macula germinativa and spot of Wagner, because discovered by Wagner, 1836.—Germinal vesicle, the nucleus of an ovum, contained in the vitellus and containing the nucleolus or germinal spot: also called vesicle of Purkinje, because discovered by Purkinje, 1825. The name, like germinal spot, is a misnomer, as this vesicle does not germinate, but soon disappears, and is replaced by a nucleus which includes male elements, in ova which are fecundated and therefore able to germinate; both terms are used chiefly in text-books of human anatomy.
Germinal (zhār-mē-nal'), n. [F., < L. germen (germin-), a sprout, offshoot, germ: see germinal, a.] The seventh month of the French revolutionary calendar. It commenced (in 1794)

lutionary calendar. It commenced (in 1794) March 21st and ended April 19th.

germinant (jer'mi-nant), a. [<L. germinan(t-)s, ppr. of germinare, germinate: see germinate.] Germinating; sprouting; beginning to grow; growing; gradually developing.

Prophecies . . . are not fulfilled punctually at once, but have springing and germinant accomplishment throughout hany ages.

Bacon, Advancement of Learning, ii. 139.

May it not one day be written, for the praise of the American Bar, that it helped to keep the true idea of the state alive and germinant in the American mind?

germination (jer-mi-nā'shon), n. [< ME. germination = F. germination = Sp. germinacion = Pg. germinacion = Sp. germinacion = Pg. germinacio = It. germinazione, < L. germinatio, sprouting forth, budding, < germinate, pp. germinatus, sprout, bud: see germinate.] The act, process, or result of germinating; the evolution of a germ or seed; the formation of an only we from a new medium. embryo from an ovum.

The perpetual leaven and germinations, the thrustings forth and swelling of his senses.

Jer. Taylor, Works (ed. 1835), II. 12.

Specifically, in bot.: (a) The process of development of the embryo of a seed into a perfect plant. The conditions necessary for germination are the presence of moisture, free oxygen, as in atmospheric air, and warmth. Moisture softens the integuments of the seed and relaxes the tissues of the embryo, at the same time dissolving such nutrient matters in the seed as sugar, dextrine, etc., in readiness for their assimilation by the embryo. The absorption of oxygen is necessary for the chemical changes which al.

changes which al-

for the chemical changes which always accompany growth. The degree of warmth needed to excite to action the vital forces of the plant varies in different species, some seeds, as those of wheat, being capable of germinating ice, while others require a temperature of over 60° F. During germination various chemical changes take place in the starch and other insoluble material stored up for the use of the embryo in the cotyledons or in the albumen of the seed, rendering them soluble and fit for assimilation, which changes are usually accompanied by an increase of temperature, as is seen in the process of malting. As an immediate result of the growing process thus excited and carried on in the seed, a root is produced which strikes downward, fixing itself in the soil and beginning to absorb thence nourishment for the new plant. At the same time the other extremity of the axis of growth is directed upward and develops a stem and leaves. (b) The similar development of a plant from the spore in cryptoganis. (c) The early period of growth in a bud, as of a bulb or of a rhizome. (d) The protrusion and growth of the pollen-tube from the pollen-grain.

germinative (jer'mi-nā-tiv), a. [= F. germinatif = Pr. germinatiu = Pg. It. germinativo; as germinate + -ive.] Pertaining to, consisting in, constituting, or capable of germination; ger-

germ-layer (jerm'lā'er), n. In biol., any blastodermic membrane or blastoderm; any layer of cells, forming a membrane, which enters into the structure of a germ in its early stages. The first is the single blastoderm of a blastula or vesicular morula. By invagination this germ-form becomes a gastrula, with two germ-layers, the hypoblastic blastodermic layer, or endoderm, and the epiblastic blastodermic layer, or endoderm, etc. the hypoblastic blastodermic layer, or endoderm, etc. grant and subsequent splitting of this into an inner and an outer layer, called splanch-nopleure and somatopleure, results in the four germ-layers of most metazoic animals. Names of special germ-layers or germ-membranes are: blastophylla, epiblast, mesoblast, hypoblast, endoderm, etc. Chey are also called layers, as skinlayer, serous layer, etc. See cuts under gastrula and gastrulation.

The Metazoa can alone be considered as true animals.

The Metazoa can alone be considered as true animals, and the origin from two primary germ-layers may be held to form the primary character of the animal kingdom.

germ-membrane (jerm'mem'brān), n. A germ-

germon (jer'mon), n. [< NL. germo; origin obscure.] Orcynus germo, a fish of the family Scombridæ, closely related to the common tunny. germ-peg (jerm'peg), n. A corruption of gem-

germ-plasma (jerm'plaz"mä), n. Protoplasm peculiar to a germ or ovum, and supposed to influence or determine the character of the remnuence or determine the character of the resulting organism, by virtue of its special chemical or molecular composition. Germ-plasma may thus be considered, theoretically, as the physical basis of all the phenomena which are grouped under the name of heredity.

The germ-plasma is regarded as a substance of peculiar hemical or even more special molecular composition chemical or even more special molecular composition, which passes over from one generation to another.

germ-pore (jerm'por), n. In cryptogamic bot., a pore or pit in the outer integument of a spore, through which the exit of the germ-tube takes

Many of these pores serve as places of exit for the tubular outgrowths from the spore at the time of germination, and may therefore be termed germ-pores; others perform no such function, and are therefore only simple pores or pits.

De Bary, Fungi (trans.), p. 100.

germ-shield (jerm'shēld), n. Same as notaspis. The germ-shield is merely the earliest rudiment of that dorsal part which first becomes defined.

Haeckel, Evol. of Man (trans.), I. 298.

germ-stock (jerm'stok), n. Same as stolo proli-

fer (which see, under stolo).

germ-tube (jerm'tūb), n. In cryptogamic bot.,
a tubular or thread-like growth first formed by
a spore in germination, which by continued development and cell-division in one or more directions becomes the thallus. In fungi the germ-tube may develop into either the ordinary

mycelium or a promycelium.

germule (jer'mul), n. [< germ + dim. -ule.]

A germ; especially, a small or incipient germ. A germ; especially, a small or inciplent germ.

The majestic tree of human thought can never be comprehended unless regard is had to the formless germule of the psychical life of the zoophite, and ascending evolution is followed up in the animal series.

Tr. for Alien. and Neurol., VI. 496.

germ-vesicle (jerm'ves'i-kl), n. In embryol., germ-vesicle (jerm'ves"i-kl), n. In embryol., a germ in a vesicular state. It is either (a) a true germ-vesicle or blastula, preceding gastrulation, as in most animals, or (b) an intestinal germ-vesicle or gastrocystis, peculiar to mammals; in the latter case it follows gastrulation, and is generally confounded with a blastula; it is what is called in human anatomy the blastodermic vesicle. See blastosphere, gastrocystis, and cut under gastrulation.

Great Geyser] in Iceland. Foreign writers gharry (gar'i), n.; pl. aharrias (-in) often use geysir as an appellative, but the only Icel. words for hot springs are hver [hverr] (a cauldron, hot well) and laug (a hot bath [a bath]). The present Geysir is never mentioned in old writers, and it seems from a record in the Icel. annals that the great hot wells in the neighbourhood of Haukadale were due to the volcanic eruptions of 1294, when old hot springs disappeared, and those now existing springs disappeared, and those now existing came up. . . The name Geysir (= gusher) must be old, as the inflexive -ir is hardly used but in obsolete words; . . . it was probably borrowed from some older hot spring" (Cleasby and Vigfusson); < geysa, gush, a secondary form, < gjösa, gush: see gush.] A spouting hot spring; a hot spring which projects water, either periodically or irregularly, to some height in the air. The Great Geyser of Iceland has been long known, and has given the name to phenomena of this character. This geyser spouts very irregularly, and sometimes throws a large volume of water to a height of

nearly 100 feet. The height of the column is probably diminishing, as some old estimates make it much greater. There are numerous geysers in the Yellowstone region of the United States, some of which throw water to an elevation of 200 feet or more, and also on the North Island of New Zealand; and in the Napa valley of California are bolling springs that have been improperly called geysers. (See boiling spring, under boiling.) The true theory of the action of the Great Geyser of Iceland, and hence of geysers in general, was first established by Bunsen. The ejection of the water is caused by explosive action, due to the heating of the water, under pressure, in the lower part of

the geyser-tube, to considerably above the boiling-point. The heated water acquires after a time elastic force sufficient to overcome the weight of the superincumbent water; and the relief from compression during the ascent is so great that steam is generated rapidly, and to such an amount as to eject violently from the tube a great quantity of the water.

Greene, Pandosto.

Syn. Ghastly, Grim, Grisly, Haggard, Hideous; pale, wan, cadaverous, frightful. Hideous may apply to sound, as a hideous noise; the others not. All in modern use apply primarily to sight and secondarily to mental perception, except haggard, which connotes sight only. Ghastly, as it is most commonly used, means deathly pale, death-like, referring to the countenance, but its signification has been extended to denote suything that is suggestive of death, or even repulsive and shocking, as Milton's "mangled with ghastly wounds" (P. L., vi. 388), "a ghastly smile" (Milton, P. L., il. 346), a ghastly jest. Grim characterizes a rigid cast of countenance, indicating a severe, stern, or even ruthless disposition. Grisly refers to the whole form or aspect, especially when dark, forbidding, or such as to inspire terror. Haggard adds to the idea of paleness of countenance that of being wasted by famine or protracted mental agony. Hideous, used of looks, applies to the whole form or scene, and neans simply repulsive, extremely unpleasant to see: as, hideous features; a hideous scene. See pale?

Her face was so ghastly that it could not be recognized.

Macaulay.

Grim-visag'd war hath smooth'd his wrinkled front. Shak., Rich. III., i. 1.

In the East Indies, a liquid clarified butter
made from the milk of cows and buffaloes, comade from the milk of cows and buffaloes, coagulated before churning. It is highly esteemed
and universally used as a substitute for oil in cooking,
especially in the preparation of food for the Brahmans and
religious mendicants, and in offerings to the gods. Ghee
is largely used medicinally as an emollient and stomachic,
and as a dressing for wounds and ulcers. For these purposes it is esteemed in proportion to its age. When carefully prepared from pure materials it will keep sweet for
a great length of time, and it is not extraordinary to hear
of ghee a hundred years old.

Syn. Ghost. Shade, Apparition, Specter, Phantom, Phantasm. Ghost is the old word for the disembodied spirit, especially as appearing to man: as, the ghost of Hamlet's father; the ghost of Banquo. Shade is a soft and poetic word for ghost: as, the shade of Creitsa appeared to Encas. An apparition is a ghost as appearing to sight, perhaps suddenly or unexpectedly; it may also be a fancied appearance, while a ghost is supposed to be real: as, Jupiter made a cloud into an apparition of June; Macheth saw an apparition of a dagger; the witches showed him an apparition of a crowned child. A specter is an alarming or horrifying preternatural personal appearance, having less individuality, perhaps, than a ghost or shade, but more than an apparition necessarily has. A phantom has an apparent, not a real, existence; it differs from a phantasm in emphasizing the unreality simply and in representing a single object, while phantasm emphasizes the deception put upon the mind, and may include more than one object.

consist generally of rows of compressed filaments arising from the outer sides of the gill-arches, between which are the gill-alits through which water is poured in respiration to bathe the gills, the set of gills being usually contained in cavities shut in by the gill-covers and communicating with the mouth. There are usually four rows of gills in true fishes, but there may be fewer; in selachians there are generally five pairs; the details of the arrangement are very various. In Amphibia the gills are similar to those of fishes in their situation and general character, but they usually present externally as tufted organs on each side of the neck, and in many cases are caducous, being replaced by lungs. In Molluca the character of the gills is very different, and their disposition is so variable that they are made a means of establishing many of the orders and subordinate groups of that division of the animal kingdom. In an oyster, for example, the gills are the folds or plaits which lie in layers around a considerable part of the circumference of the animal. (See cuts under Dendronous, Doris, Lamellibranchiata, and Polyplacophora.) In Crustacea the gills are commonly appendages of some of the legs, very variable in number and situation, as podobranchise, pleurobranchis, etc. (See spipodite, and cut under Podophthalmia.) Among Insecta gills are filamentous or foliaceous external appendages of the trachea of aquatic insects which breathe in the water. In Arachaida the gills are the external parts of the breathing-organ, each gill consisting of a minute slit covered with a scale; there are two or four of these on the lower side of the abdomen, near the base. In Vermes gills are the respiratory organs, of whatever character, commonly fringing the sides of the body or forming tufts on the head.

The United States gill contains 7.217 cubic inches, equal to 118.35 cubic centimeters. The British imperial gill contains just 5 ounces avoirdupois of distilled water at 62° F., weighed in air under a pressure equal to that of 30 inches of mercury at London, being equal to 142 cubic centimeters or 1.2 United States gills. Until about 1825 the gill was not considered as part of the regular system of English measures of capacity, and there was some want of uniformity in the use of the name. (See the extract from Carew.) In the north of England and parts of Scotland a half-pint was called a gill. The Scotch gill was $\frac{1}{100}$ of a Scotch pint, and was therefore about equal to the English gill.

A contrivance, as a ring moving on horizontal pivots, for securing free motion in suspension, or for suspending anything, as a chronometer, so that it may keep a constant position or remain in equilibrium. The name is suspension, or for suspending anything, as a chronometer, so that it may keep a constant position or remain in equilibrium. The name is most commonly used in the plural, applied to two movable hoops or rings, the one within the other, the outer capable of rotation about a fixed horizontal axis lying in its plane, and the inner capable of rotation about an axis lying in the planes of both rings and perpendicular to the fixed axis. The mariners' compass is suspended by such a contrivance, and, having a free motion in two directions at right angles to each other, it maintains the card in a horizontal position, notwithstanding the rolling of the ship.

One of a peculiar vagabond race which appeared in England for the first time about the beginning of the sixteenth century, and in eastern Europe at least two centuries earlier, and is now found in every country of Europe, as well as in parts of Asia, Africa, and America. The Gipsies are distinguishacountry of Europe, as well as in parts of Asia, Africa, and America. The Gipsies are distinguishable from the peoples among whom they vove by their bodily appearance and by their language. Their forms are generally light, lithe, and agile; skin of a tawny color; eyes large, black, and brilliant; hair long, coal-black, and often ringleted; mouth well shaped; and teeth of dazzling whiteness. Ethnologists generally concur in regarding the Gipsies as descendants of some obscure Hindu tribe. They pursue various nomadic occupations, being tinkers, basket-makers, fortune-tellers, dealers in horses, etc., are often expert musicians, and are credited with thievish propensities. They appear to be destitute of any system of religiou, but traces of various forms of paganism are found in their language and customs. The name Gipsy is also sometimes applied to or assumed by other vagrants of like habits.

girdelt, n. A Middle English form of girdle¹.
girder¹ (ger'der), n. [\(\sigma girdl + - er^1.\)] 1. One
who or that which girds, binds, or encircles.
Specifically—2. A main beam of either wood
or iron, resting with each end upon a wall or or iron, resting with each end upon a wall or pier, used to support a superstructure or a superincumbent weight, as a floor, the upper wall of a house, the roadway of a bridge, or the like. Wooden girders, when in two or more pieces, take the form of built-up beams, arched beams, or compound beams. When composed of upper and lower horizontal members, united by vertical and diagonal pieces, the girder is called a lattice-girder. When reinforced by iron rods a wooden beam may form a trussed girder. Iron girders

a to l, wrought-iron girders; m to s, cast-iron girders; sa, box-girder; bb, compound I-girder; cc, compound-beam girder; dd, I-girder.

are simple or compound, and are made of cast-iron or wrought-iron, or both combined. The most simple form is the common rolled or cast I- or T-beam. Compound beams are composed of plate- and angle-irons built together in various forms, the most simple having a plate-iron web united to upper and lower plate-iron members by means of angle-irons. More complicated forms include girders with two webs (the box-girder), or with three or more webs, or with groups of rolled beams united. Iron girders also appear in many latticed forms, and are largely used in bridge-building. (See bridge, girder-bridge.) A very notable and extensive use of girders is in the structure of elevated railroads. Also called girding-beam.

Lyly, Alexander and Campaspe, iii. 2.

girder-bridge (ger'der-brij), n. A bridge in which the support is afforded by girders or which the support is afforded by girders or beams. At the period of development of railway construction many bridges were built with cast-iron girders; the limit of safe span of such was generally accepted as 40 feet. This limitation, and the treacherous nature of the material, led to the substitution of wrought-iron formed into plates, which were placed vertically and strengthened and stiffened by angle-irons. The latter form of construction culminated in the box-girder bridges or tubular bridge. Bridges with framed girders are more generally called trues-bridges or arched-pirder bridges. See arched-beam bridge, under bridgel, 1.

A band, belt, or zone; something drawn round the waist of a person and fastened: as, a girdle of fine line; a leathern girdle. The primary was of the direlection. person and fastened: as, a girdle of fine linen; a leathern girdle. The primary use of the girdle is to confine to the person the long flowing garments anciently, and still in some countries, worn by both men and women; and it is now frequently used in women's dress (commonly called a belt) and in military costume (a belt or sush). (See cestual.) The girdle has also served for the support of weapons, utensils, bage or pockets, etc. In the middle ages books were sometimes bound with a strip of fiexible staff hanging from one end of the volume, which could be drawn through the girdle and secured. Among many peoples, the girdle being large and loose, the scabbard of a sword or long dagger is passed through the girdle instead of being hung from it, a hook or projecting button serving to hold it in place. In ecclesiastical use the girdle is a cord with which the priest or other cleric binds the alb about the waist. Formerly it was flat and broad, and sometimes adorned with jewels; in the Roman Catholic Church it has been changed to a long cord with dependent extremities and tassels. It is regarded as a symbol of continence and self-restraint. It is usually of linen, though sometimes of wool, and is generally white, but sometimes colored to adapt it to the color of the other vestments.

=Byn. Give. Confer, Bestov. Present, Grant. Give is generic, covering the others, and applying equally to things tangible and intangible: as, to give a man a penny, a hearing, one's confidence. Conferving is generally the act of a superior allowing that which might be withheld: as, to confer knighthood or a boon. Bestow and grant emphasize the gratuitousness of the gift somewhat more than the others. Present implies some formality in the act of giving and considerable value in the gift. Grant may presuppose a request, may imply formality in the giving, and may express an act of a sovereign or a government: as, to grant land for a hospital; but it has broader uses: as, to grant a premise.

See drift, 5.—Glacial phosphoric acid, pure monobasic or metaphosphoric acid, HPOs. It is a white, brittle, deliquescent solid.—The glacial epoch, a period of the earth's history when, as maintained by many geologists, an ice-sheet extended from the Scandinavian range in all directions, encroaching on Finland, northern Germany, and even a part of Great Britain; the glaciers of the Alps, Cancasus, and Pyrenees being also at that time considerably larger than they are now. Traces of former glaciation are observed in abundance over wide areas in north-eastern North America, and are ascribed by most geologists to the former presence of an ice-sheet covering that region. The difficulty of accounting for the presence and movement of such a sheet on the American side of the Atlantic is much greater than is the case on the European side. Since in New England and the region of the great lakes much of the superficial detritus has been moved southward from the place of its origin for a greater or less distance, and since this fact was frequently observed and much commented on before ice became a recognized factor in geology, the phenomena now usually designated as glacial in Europe have been in America associated with the word drift; the loose material on the surface being called by that name, and the epoch of its accumulation, the drift epoch.

glaciation (glā-shi-ā'shon), n. [< glaciate +
-ion.] 1. The act of freezing.

The water or other liquor usually beginning to freeze at the top, and it being the nature of ylaciation to distend the water and aqueous liquors it hardens, it is usually and naturally consequent, that when the upper-crust of ice is grown thick, and by reason of the expansion of the frozen liquor bears hard with its edges against the sides of the glass contiguous to it, the included liquor (that is by degrees successively turned into ice), requiring more room than before, and forcibly endeavoring to expand itself every way, finds it less difficult to burst the glass than lift up the ice.

Boyle, Hist. Cold, v.

8. In geol., the present or former existence of a mass of ice, glacier, or ice-sheet, covering a certain region; subjection to the action of ice. Thus, it is said that the surface of the country in Sweden exhibits the effects of a former glaciation—that is, that the surfaces of the rocks in many places are smoothed or striated, as they are under or near actual glaciers in the Alps or elsewhere. Such surfaces are said to be glaciated.

4. A consequence of or phenomenon caused by such a process or covering, as the striation and smoothing of rock-surfaces.

glacier (glā'shier or glas'i-er), n. [< F. glacier (orig. Swins.) > G. glatscher), < glace, ice, < L. glacies, ice.] The form in which the snow, falling on the higher parts of those mountain-ranges which are above the snow-line, finds its way down into the valleys. Under suitable climatic conditions, the snow which thus falls does not all disappear by evaporation, or melt at once and run off in the form of water, but becomes gradually converted into ice, and moves slowly down the mountain-alope in the depressions or valleys until it reaches a point where the mean temperature has so far risen that evaporation and melting counterbalance the supply from above. Here the glacier ends, and a stream of water begins, which is often the head of some large river, as the Gangootri glacier of the Ganges, or the Rhone glacier in of the river of that name. The snow of the glacier in ot transformed into ice at once, but passes through the intermediate stage of nevé (German frn.). (See frn.) Several subordinate glaciers often combine to form one large one, a result dependent on the topographic alconition to unite in forming one great glacier. The loc-stream of the longest glacier in the Swiss Alps, the Gross Altesch, was in 1880 10 miles in length; some in the Himalayas are four times as long. From the cliffs which overhang the glacier is always b

In Rom. antiq., one who fought in public for the entertainment of the people, either with other gladiators or with wild aniin public for the entertainment of the people, either with other gladiators or with wild animals. Gladiators were at first prisoners, slaves, or condemned criminals; but afterward freemen fought in the arens, either for hire or from choice. Under the empire, knights, senators, and even women exhibited themselves in this way. Gladiators were first exhibited only on the occasion of public funerals, but afterward at entertainments of various kinds, and especially at public festivals given by the ediles and other magistrates. They usually fought in the amphitheater, sometimes in the forum, sometimes at the funeral pyre. They were kept and trained in special establishments or schools, sometimes by persons who let them out for hire, sometimes by citizens who wished to exhibit them themselves. Gladiators were divided into different classes, according to their arms or mode of fighting. Thus, retierii were such as carried a kind of trident and a net (rete), in which they endeavored to entangle their opponenta, usually secutores (pursuers), who were lightly armed; Thraces were those armed with the round shield or buckler of the Thracians and a short aword or dagger; the mirmillones had an oblong shield curved to suit the shape of the body, and fought with either the Thraces or the retiarii. There were also those who fought bilindfolded, their helmets being without eye-holes (andabatas), in troops (caterwari), in chariots (assedarii), on horse-back (equites), etc. In case the vanquished was not killed in the combat, the people were usually allowed to decide his fate. If they decreed his death, they extended their hands with the thumb bent and concealed (premo) by the clanched fingers; if they voted to spare him, they held out their hands with the thumb extended outward (certo). These precise gestures are still a subject of controversy, but the texts appear to support the version here given. According to a common interpretation, the downward gesture of the arm with fingers closed and thumb extended was the death-sentence, as shown in Gérôme's well-known painting "Pollice Verso." Gladiatorial shows were maintained for nearly seven hundred years, till the fifth centured.

—Syn. Gladness, Joy, Pleasure, Delight, Triumph. Gladness is less often used of a weak feeling than glad; it generally stands for a feeling that is strong but tranquil, and showing itself chiefly in the face. Hence it is often used and demonstrative. This distinction between gladness and joy is abundantly illustrated in the Bible. Pleasure is the most general of these words, representing all degrees of feeling, and vicious or harmful indulgence as well as harmless enjoyment. In its primary sense it indicates a feeling less distinctively cheerful than gladness and less profound or demonstrative than joy, but with much of glow. Delight is a high degree of pleasure; formerly the word was much used for low pleasure (see quotation from Milton under delight), but it has been redeemed so that it is now sarely used for anything but an ecutatic pleasure of joy. Triumph is often used for joy over success, especially only invictory. All these words may express malign feelings, as joy in the adversities of a rival, except gladness, which generally expresses a pure and worthy feeling. See animation, mirth, hilarity, happiness.

gland (gland), n. [< F. glande, f., a gland (cf. F. gland, m., = Pr. glant, glan = It. ghianda, an acorn), < L. glans (gland-), an acorn () dim. glandula, a gland: see glandule); cf. Gr. βάλανος, an acorn, prob. < βάλλεν, throw, cast.]

1. In anat.: (a) A lymphatic ganglion; one of the numerous small, smooth, rounded organs which occur in the course of the lymphatics: formerly more fully called conglobate gland. See cut under lymphatic. (b) Some secretory part or organ: a secreting crypt. follows. cretory part or organ; a secreting crypt, fol-licle, or the like, generally of mucous or tegulicle, or the like, generally of mucous or tegumentary surfaces, or a conglomeration of such parts composing some organ which secretes or excretes a substance peculiar to itself, as the liver, kidney, pancreas, parotid gland, testicle, etc., or the lacrymal, sebaceous, salivary, gastric, intestinal, and other glands. Glands, thus specifically defined, are either simple, consisting of a single secretory follicle or receas, or compound, consisting of a aggregate of such structures; the latter are also called tubular, saccular, racemose, etc., according to their intimate structure. The so-called ducless or vascular glands (see (c)) are not in this category, it being the essential character of a gland in this sense that it have an outlet for its special secretion. Glands of both these kinds were formerly classed as conglomerate glands, in distinction from conglobate or lymphatic glands. (c) Some smooth rounded part or organ of undetermined tion from conglobate or tymphatic glands. (c) Some smooth rounded part or organ of undetermined function, as the spleen and the thyroid and thymus. See ductless gland, below. (d) The glans penis or glans clitoridis, the head of the penis or of the clitoris.—2. In bot.: (a) An acorn; also, the similar involuerate nut of the hazel, beech, and chestnut. (b) A secreting organ upon the surface of any part of a plant, or par-tially embedded in it. The term is extended to in-clude also any protuberance or structure of a similar nature, though it may not secrete. Glands vary much in form and appearance, and in the character of their secre-

tions.

3. In mach., a contrivance, consisting of a crosspiece or clutch, for engaging or disengaging machinery moved by belts or bands.—4. In steam-engines and other machines: (a) A stuffing-box. (b) A joint so tightly packed as to retain oil or other lubricating fluid for a considerable length of time. Also called gland-box.

As the duct of the mushroom-shaped gland in the adult male [blatta] always contains spermatosos, and no other organ containing spermatozos is to be found, this gland has naturally been taken for the testis. Rajewaky, however, has recently pointed out that the true testes are situated in the tergal region of the abdomen. . . He traces the efferent duct of the testes to the glands just mentioned. Huzley, Anat. Invert., p. 359.

Midamental glands, those glands which secrete the viscid substance by which the ova of some animals, as cephalopods, are invested and aggregated into various shapes.

A pair of so-called nidamental glands are the accessory organs of the female apparatus [of generation in cephalopods]; they consist of elongated lamellar tubes, which are placed in the anterior region of the animal; their short efferent ducts open beside the generative orifice. Their secretion appears to cement the ova together.

"Syn. 1. Glare, Glisten, Scintillate, Glister, Glitter, Gleam, Sparkle, Coruscate, Glistmer, Flicker. Glare indicates a steady dazzling, or painful excess of light; glisten is a popular word, while scintillate is the exact or formal word, for a light that is unequal or is slightly interrupted: as, glistening eyes, dew, stars; scintillating stars. Scintillate is also used for the throwing off of sparkles: as, the esintillating from at the forge. Glisten represents a softer, and glister a harder, light than glister, glitter implying a cold, metallic ray: as, glistering bayonets; "all is not gold that glisters." Gleam stands for a small but generally steady and pleasant light, a long ray: as, the light gleamed through the keyhole; hope gleamed

upon him. Sparkle represents a hard light that seems to be emitted irregularly in ignited particles or visible parts: as, sparkling diamonds, eyes, wit. Coruscate expresses a rapid throwing off of vivid or brilliant fisshes of light, as in the aurora borealis or by a revolving piece of fireworks. Glimmer represents a faint and unsteady light: as, stars glimmering through the mist. Flicker goes further, and suggests, as glimmer does not, a probable extinction of the light: as, a fickering taper. See flame, n., and radiance.

I. n. 1. A substance resulting from the fusion of a combination of silica (rarely boracic
acid) with various bases. See vitreous. It is acid) with various bases. See virreous. It is usually hard, brittle, has a conchoidal fracture, and is more or less transparent, some kinds being entirely so while other substances to which the name of glass is commonly given are, in consequence of the impurity of the

material or imperfection in the manufacture, only slightly translucent. Glass is an inorganic substance, as would naturally be inferred from its being the result of fusion, but some organic substances are called viterous. Some rocks have a viterous structure, like that of artificial glass, as, for instance, obtains, which is often called volcantic glass, as, for instance, obtains, which is often called volcantic glass, as, operation and and are all the source of the control of the control is incomplete, and also because they are too deeply colored by metallic ordic. Glass, as the word is generally understood, is an artificial product, and one of the most important of manufactured articles. Its valuable qualities are: the ease with which it can be made to take any desired shape; cheepness, the result of the small cost of the materials of which it is made; durability, and especially resistance generally; transparency, a quality of the utmost importance, as evidenced by its use for windows and in optical and chemical instruments; and the beautiful luster of those kinds which are used for ornamental purposes. Almost the only drawback to these good qualities of glass is its brittleness. The bases used in glass-manufacture are chiefly sods, potash, lime, alumina, and oxid of lead, and the quality of the article produced depends on the nature and amount of the basic material united with the silica. The combinations of silica with a simple alkaline base, either potash or sods, are soluble in water, and are known as stater-glass. (See soluble glass, below). They are useful substances, but very different in their propertice from what is ordinarly known as glass. In addition to the alkaline base there must be an alkaline earth or a metallic orid. The cheapest glass is that used for bottles; in this the basic material is chiefly lime, with some potash or sods, and alumins. Glass for medicine-bottles differs from ordinary bottle-glass in containing more potants, and the plass more fusible; lumina diminishes the content of t

stay under ground. Though well known to the Greeks, glass was in less common use among them, owing to the perfection of their ceramic ware. In Europe the most artistic manufactures of glass have been, since the middle ages, those of Venice, characterized by great elegance of form and lightness and thinness of substance, and those of Bohemia, of later date than the Venetian, and especially notable not only for grace of form, but for enameling, cutting, and engraved decoration.

No specialized hot-house treatment, as if a boy were an orchid or other frail exotic to be glassed away from the rough air of manhood.

The Century, XXXII. 862. 2. To make glassy; give a glazed surface to; glaze or polish.

I have observed little grains of silver to lie hid in the small cavities, perhaps glassed over by a vitrifying heat, in crucibles wherein silver has been long kept in fusion.

To obtain the finish, the hides are blacked on the fiesh side with a preparation of soap and lamp-black . . . and again glassed.

Harper's Mag., LXX. 278.

3. To reflect, as a mirror or other reflecting surface; show or observe a reflection of.

Then take a shield I have of diamonds bright, And hold the same before the warrior's face, That he may glass therein his garments light. Fairfax, tr. of Tasso, x

duplicate glassed in the water, as if the fiery flower had dropped a petal. Aldrich, Ponkapog to Pesth, p. 160. glass-argonaut (glas 'är 'gō-nāt), n. A heteropod of the family Firolidæ (or Carinariidæ): so called because the shell is thin and glass-like, and shaped like that of an argonaut

glass-blower (glas 'blō'er), n. One whose business is to blow and fashion glass.
glass-blowing (glas 'blō'ing), n. The process of making glassware and window-glass by taking a mass of viscid glass from the meltinging a mass of viscid glass from the meltingpot on the end of a blowing-tube and inflating
it by blowing through the tube. For common
window-glass the hot blown mass is extended into a long
cylinder by swinging a bulb of hot glass from a bridge on
which the workman stands. It is then cut open and flattened out in the flattening-furnace. For fine window-glass
the bulb of blown glass is cut open and whirled round in
the flashing-furnace till it flashes, or opens into a flat disk
with a bull's-eye in the center. A small quantity of glass is
also put into molds, and then expanded by blowing till it
fills the molds. Blown glass is also cut and shaped while
hot, and decorated, twisted, and united with other pieces
of glass in many different ways. The term glass-blowing
is also applied, though incorrectly, to the making of spun
glass and fligree-glass by melting and molding rods of soft
Bohemian glass in the flame of a blowpipe. Toys and ware
made in this way are not properly called blown glass, but
fligree-glass.

fligree-glass.

class-cavity (glas'kav'i-ti), n. See inclusion.

classchord (glas'kord), n. A musical instrument, having a keyboard like a pianoforte, in

ment, having a keyboard like a pianoforte, in which the tone is produced by cloth-covered hammers and bars or bowls of glass.

glass-cloth (glas'klôth), n. 1. Linen cloth usually woven with a slight open pattern of colored threads, like gingham, used originally as a towel for drying fine porcelain, glass, etc., and now employed as a background for embroidery.

Than to abhor himself.

glassful¹ (glas'fùl), a. [Irreg. < glass + -ful, 1.] Glassy; shining like glass.

All the vaine fome, of all those snakes that ringes, Minervas glasseful! shield can never taint.

Marston, The Fawne, Epil.

glassful² (glas'fùl), n. [< glass + -ful, 2.] As much as a glass holds. broidery.

Well scrape with glass or steel scraper, afterwards with finest glass-cloth. Workshop Receipts, 1st ser., p. 407. 2. A woven fabric made of threads of glass, which are very pliable when extremely thin. The fibers are bunched without twisting, and the stuff is woven of these bunches or groups. glass-coach (glas'kōch'), n. A coach, superior to a hackney-coach, hired for the day or any short period as a private carriage: so called because originally only private carriages had glass windows. [Eng.]

My Lady Peterborough being in her glass-coach, with the glass up, and seeing a lady pass by in a coach whom she would salute, the glass was so clear, that she though it had been open, and so ran her head through the glass.

Pepys, Diary, III. 254.

I have been to Holland House. I took a glass-coach, and arrived, through a fine avenue of elms, at the great entrance toward seven o'clock.

Mocauley, Life and Letters, I. 191.

glass-crab (glas'krab), n. A crab of the spurious genus Phyllosoma, or of the spurious order Phyllosomata—that is, any young shrimp of either of the families Palinuridæ and Scyllaridæ.

These larvæ are as thin as paper, flat and transparent, and have no resemblance to the adult. glass-cutter (glas'kut'er), n. 1. One whose occupation is the cutting of glass, or the grinding of it into various ornamental forms.—2. That which cuts or is used for cutting glass. glass-cutting (glas'kut'ing), n. The art of ornamenting the surface of glass vessels or ware by grinding it. The first or rough grinding is done with an iron wheel with sand and water, finer grinding with fine stone wheels, and finishing and polishing with wooden, cork, or brush wheels, or wheels covered with leather, india-rubber, or cloth, charged with emery-powder, punice-stone powder, putty-powder, rouge, or other polishing material. Only flint-glass is used, and ware so treated is called cut glass. Glass is also said to be cut when treated by the sand-blast, whenever the work is more than a simple depolishing of the surface. See sand-blast.
glass-dust (glas'dust), n. Glass more or less

glass-dust (glas'dust), n. Glass more or less finely powdered, used in the arts for grinding and polishing, and especially for the manufacture of glass-paper (which see). It is imported into the United States from those countries where glass is made in quantity, as Bohemia, and where refuse pieces are utilized in this way.

glassent (glas'n), a. [< glass, n., + -en². The older form is glazen, q. v.] Glass; glassy; glazed.

Buy a loaf of wace; Do shape it bairn and bairnly like, And in it twa glassen een you'll put. Willie's Ladye (Child's Ballads, I. 165).

Witte s Leage (Child S Dallaus, A. 200). He that no more for age, cramps, palsies, can Now use the bones, we see doth hire a man To take the box up for him; and pursues The dice with glassen eyes to the glad viewes Of what he throws. B. Jonson, Epistle to a Friend.

glass-engraving (glas'en-grā'ving), n.

glass-engraving (glass en-graving), n. The art of decorating glass by grinding and depolishing; glass-cutting.

Chasserian, a. See Glaserian.

from the whitish iris.—2. A local name of the wall-eyed pike of the United States, Stizostedion vitreum, a pike-perch of the family Percidæ. See cut under pike-perch.
glass-eyed (glas'id), a. Having a white eye, or one which in some other respect, as texture or fixedness, is likened to glass or to a glass

eye; wall-eyed; goggle-eyed.
glass-faced (glas fast), a. Having a face of glass, or like a glass or mirror.

From the glass-fac'd flatterer
To Apemantus, that few things loves better
Than to abhor himself. Shak., T. of A., 1. 1.

much as a glass holds.

"Ale, Squeery?" inquired the lady. "Certainly," said Squeers, . . . "a glassful."

Dickens, Nicholas Nickleby, vii.

glass-furnace (glas' fer' nas), n. In glass-manuf., a furnace in which the ingredients are fused together; in a process in which frit is used, the second or refining furnace, in which the frit is reheated and made ready for workthe frit is reneated and made ready for working. The regenerative system has been applied to such furnaces and gas employed as a fuel. In the Siemens form the furnace itself forms a melting- and refining-tank, in which the glass is made continuously, without the aid of independent glass-pots. See regenerator and furnace. glass-gall (glas gal), n. See anatron, 1. glass-gazing (glas ga'zing), a. Addicted to viewing one's self in a glass or mirror.

A... whoreson, glass-gazing, superserviceable, finical Shak., Lear, ii. 2.

glass-glazed (glas'glazd), a. Covered with or glass-glazed (glas glaze), a. Covered with or as if with glass.—Glass-glazed ware. (a) A ce-ramic ware whose surface is covered with a glaze of pure glass without lead. See glaze. (b) Ware whose glaze has definite thickness and forms a vitreous envelop, as dis-tinguished from those glazes which have no perceptible thickness and seem a mere polishing of the surface. glass-grinder (glas'grin'der), n. One whose occupation is the grinding and polishing of glass. glass-grinding (glas'grin'ding), n. The process of grinding glass as a preparation for polishing it, or for the production of ground glass. glass-hard (glas'hārd), a. Hard as glass.

Two similar rods of steel, 1.8^{mm}. in diameter and 6^{mm}. long, tempered glass-hard, one inserted in each spiral.

Amer. Jour. Sci., 3d ser., XXXI. 257.

glass-house (glas'hous), n. 1. A house where glass is made; a manufactory of glass.—2. A greenhouse, as being glazed or covered in with glass. See glass house, under glass, a.—3. A room with a glass roof, in which the best arrangements of light and shade can be produced for photographing purposes.

By looking at some point on the camera, which is situated in the darkest part of the glass-house, the eyes will be able to remain quite at ease. Silver Sunbeam, p. 43.

glassily (glas'i-li), adv. In a glassy manner; in such a way as to resemble glass.
glassin, n. See glossan.
glassiness (glas'i-nes), n. [< glassy + -ness.]
The quality of being glassy; a vitreous ap-

pearance. The glassyness (if I may be allowed the expression) of the surface throws, in my opinion, a false light on some parts of the picture.

Smollett, France and Italy, xxxi.

glassing (glas'ing), n. [Verbal n. of glass, v.]
A method of finishing or dressing leather by
rubbing it with a slicker or glassing-jack.

glassing-jack (glas ing-jak), n. A machine for polishing and smoothing leather by means of

a slicker of plate-glass. glassing-machine (glas'ing-ma-shēn"), n. Same as glassing-jack.

The glassing-machine . . . was invented in 1871 and further improved in 1875 by John P. Friend, and is adapted for work on all kinds of upper leather, sheep, goat, and Morocco.

C. T. Davis, Leather, p. 458.

Glassite (glas'īt), n. [< Glass (see def.) + Glassite (glas'it), n. [Guas (see uc.) -ite2. The Sc. name Glass is prob. Gael. glas, gray: see Glas-.] A member of a religious sect in Scotland, founded by John Glass (1695-

1773). See Sandemanian. glass-maker (glas' mā'ker), n. A maker of glass-maker (glas ma ker), n. A maker of glass.— Glass-makers' chair, a bench having two arms of iron projecting horizontally far in front of the workman when seated. On these arms he rolls the pontil, while fashioning the vessel at the extremity of it by means of instruments held in his right hand. E. H. Knight.— Glass-makers' soap. See glass-soap.

glass-making (glas 'mā king), n. The making of class or glassware. The process of making

glass-making (glas 'mā' king), n. The making of glass or glassware. The process of making glass consists essentially of the fusing together in a glassfurnace, usually in a fire-clay melting-pot or crucible, of the ingredients, after mixing them well, and the subsequent treatment of the molten mass or metal in accordance with the quality of the product or the uses which it is to serve. After vitrification is complete and the soum of impurities or glass-gall which rises to the surface has been removed, the temperature of the furnace, which may have reached from 10,000' to 12,000' x., is considerably reduced, so as to bring the fluid and limpid metal into a condition of viscosity, rendering it capable of being worked. The working, by which means the glass is made to assume its definitive form, is in general performed by blowing (see glass-blowing), casting, or pressing in molds. See finit-glass, glass-cutting, glass-furnace, plate-glass. glassman (glas 'man), n.; pl. glassman (-men). One who makes or sells glass; also, one who inserts window-glass in sashes; a glazier.

Where have you greater athelists than your cooks?
Or more profane, or choleric, than your glassmen?
B. Jonson, Alchemist, ill. 1.

glass-metal (glas'met'al), n. The fused and refined material of which glass is made.

Let proof be made of the incorporating of copper or brass with glassmetal.

Bacon, Physical Remains.

brass with glassmetal. Bacon, Physical Remains. glass-mounter (glas'moun'ter), n. One who embellishes glass articles with ornaments. glassock (glas'ok), n. [Cf. the equiv. glassin, glashan, glossin, glossin; prob. < Ir. Gael. glas, gray, pale, wan (see Glas-); cf. Gael. glasag, a water-wagtail, the female of the salmon, glasiasg, gray fish, such as cod, ling, haddock.] The coalfish. [Local, Eng.] glass-oven (glas'uv'n), n. A hot chamber in which newly made glass in sheets or ware is gradually cooled: a glass-annealing furnace:

gradually cooled; a glass-annealing furnace;

glass-painter (glas'pān'ter), n. One who produces designs in color on or in glass.
glass-painting (glas'pān'ting), n. 1. The art or practice of producing designs in color on or or practice of producing designs in color on or in glass. In glass-painting (or glass-staining, as it is also called) two methods are chiefly employed: (a) the enamel method, consisting in painting on the glass in colors, which are then burned into it; (b) the mosaic method, consisting in forming a design of separate pieces of stained or colored glass set in cames of lead and braced and supported by a framework of iron bars, the color be-

ing imparted to the glass in the making. By this latter method were made the splendid medieval windows of the thirteenth century, the beautiful color-effects of which have thus far defied imitation, in spite of modern perfected methods. These admirable color-effects are now recognized to be due not only to perfection of the colors used, and to their judicious juxtaposition and skilful combination with white glass to relieve them and hinder where desirable the blending of contiguous tints, but to unevenness of tone and thickness of the glass primarily due to imperfect processes of manufacture. This last quality is now imitated with artistic success, such glass in general being made by hand, as ordinary machine-made glass is necessarily of even thickness and shade. A combination of the enamel and mosaic methods, known as the movaic-snamel method, in which part of the design is in mosaic and part in enamel, is now commonly used.

2. A painting upon glass; a surface of glass or painting, or both.

3. I glass-paper (glas'pā'pèr), n. A fine kind of sandpaper made with powdered glass.

3. I glass-paper (glas'pā'pèr), v. t. To polish by rubbing with glass-paper.

When the first coating of varnish is perfectly dry, glass-paper the whole surface, and make it smooth as heferences.

When the first coating of varnish is perfectly dry, glass-paper the whole surface, and make it smooth as before. Workshop Receipts, 1st ser., p. 84.

glass-pot (glas'pot), n. A vessel or crucible used for fusing the materials of glass in a glass-furnace. Glass-pots are made of the most refractory earths or fire-clays by a tedious process, to insure the perfect uniformity and dryness necessary to enable them to resist the great heat of the furnace, and they constitute one of the chief elements in the cost of glass. The glass-pots for lead-glass (flint-glass and strass) are covered, and have an opening at the side; for all other kinds of glass they are open, with sloping sides, like pails without handles.

glass-press (glas'pres), n. A press for compressing glass after it has been placed in a mold. It is a plunger which may be brought down upon the open top of the mold placed beneath it, the mold being firmly held in place while the pressure is applied.

glass-rope (glas'rop), n. The stem of a glass-sponge, as Hyalonema.

glass-shell (glas'shel), n. A pteropod of the family Hyaleidæ: so called from the thin hyaline shell.

glass-shrimp (glas'shrimp), n. The larva of glass-pot (glas'pot), n. A vessel or crucible used

line shell.

glass-shrinip (glas'shrimp), n. The larva of stomatopodous crustaceans, as that of Squilla gor Gonodactylus, in certain stages of development which have occasioned the spurious genera Alima and Erichthus. See Stomatopoda.

glass-silvering (glas'sil'vering), n. The art of covering glass with a metallic film which will serve as a reflecting surface, as for a reflector or looking glass. In orange method a sheet of

will serve as a reflecting surface, as for a reflector or looking-glass. In one method a sheet of tin-foll is laid upon a marble table and painted with mercury till an amagam is formed. More mercury is added to form a shallow pool, and upon this the sheet of glass is laid and pressed down to drive out bubbles. A thin film of amagam clings to the glass, and forms the silver-like mirror. In another method a bath consisting in part of silver nitrate is employed, which forms an adherent film of silver on the glass. The second process is used in silvering hollow and convex glassware.

glass-snail (glas'snāl), n. A snail of the genus Vitrina: so called from its pellucid vitreous shell.

glass-snake (glas'snak), n. 1. A large limb-less lizard, Ophiosaurus ventralis, abundant in the southern United States: so called from its

general resemblance to a snake and the extreme fragility of its tail. The tail grows again, to some extent, after being broken of; it is about twice as long as the body. The animal attains a length of some 2 feet, and is of a greenish color above, marked with black, and pale-yellowish below. Though destitute of feet, it makes its way along very well by wriggling like a snake. It is harmless. Also called joint-snake.

2. A lizard of the genus Pseudopus, as P. pallosi, inhabiting Europe and Asia. P. gracilis of India is the Khasya glass-snake, without even the rudiments of limbs.

glass-soap (glas'sōp), n. Peroxid of manganese, used to remove from glass the green color

caused by the presence of iron. E. H. Knight. Also called glass-makers' scap.
glass-soldering (glas'sol'der-ing), n. The art of uniting pieces of glass by partly fusing the surface to be applied to one another. Also

surfaces to be applied to one another. Also called glass-welding.
glass-spinning (glas'spin'ing), n. The art of drawing out fine filaments or threads of hot glass to make spun glass.
glass-sponge (glas'spunj), n. A species of silicious sponge, Hyalonema sieboldi, found in Japan. It consists of a cup-shaped spongy body supported by a number of twisted, glass-like, silicious fibers, which are sunk in the mud of the sea-bottom. The term is extended to several similar or related silicious sponges whose framework resembles spun glass, as Venus's flower-basket. See cut under Euplectella.

glass-stainer (glas'sta'ner), n. 1. A maker of stained glass.—2. A glass-painter. glass-staining (glas'sta'ning), n. The process of coloring glass during its manufacture, especially for the production of the glass used for colored or painted windows, or glass-painting. glass-tinner (glas'tin'er), n. A workman who applies the foil to the back of the glass in making mirrors.

The glass-tinner, standing towards one angle of his table, sweeps and wipes its surface with the greatest care, along the whole surface to be occupied by the mirrorplate.

Ure, Dict., III. 356.

like.—2. The objects produced in a glass-factory, especially vessels and utensils made of

glass-worker (glas'wer'ker), n. One who works in glass; one engaged in any capacity in the manufacture of glass.

It must be left to practical glass-workers to determine whether a spiral form is the best for the tube.

Urs, Dict., IV. 91.

glass-works (glas'werks), n. pl. and sing. An establishment where glass is made; a manufactory of glass; a glass-house.
glass-wormt (glas werm), n. A glow-worm.

glasswort (glas'wert), n. A plant of the chenopodiaceous genus Salicornia, succulent saline plants with leafless jointed stems and containpiants with fearless jointed steins and containing a large proportion of soda. Great quantities of the sahes of these and allied plants were formerly used, under the name of barilla, in the manufacture of glass and soap. Also called marsh-samphirs.—Prickly glasswort, the saltwort, Salsola Kait.

glassy (glas'i), a. [< ME. glasy; < glass, n., + -y¹.] 1. Resembling or of the nature of glass; vitreous: as a glassy substance.

-y¹.] 1. Resembling of of the vitreous: as, a glassy substance.

Ous: as, a glassy succession of the clear hysline, the glassy sea.

Millon, P. L., vii. 619.

2. Resembling glass in some quality, as smoothness, brittleness, transparency, or power of re-flecting; hence, as applied to the eye or glance, having a fixed, unintelligent stare, as in idiocy, stupidity, spasm, terror, insanity, or death.

There is a willow grows aslant a brook,
That shows his hoar leaves in the glassy stream.
Shak., Hamlet, iv. 7.

Death stood all fixed in his glassy eye; His hands were withered and his veins were dry. Byron, Saul.

In one long, glassy, spectral stare,
The enlarging eye is fastened there.

glaucescent (glå-ses'ent), a. [= F. glaucescent = Sp. glaucescente, < NL. glaucescent(t-)s (in some specific names); as glauc-ous + -escent.] Becoming glaucous; somewhat or faintly glaucous. Also glaucine.

glaucic (glå'sik), a. [= F. glaucique; as glaucium + -ic.] Of or pertaining to plants of the genus Glaucium.—Glaucic acid, a name formerly applied to an acid obtained from Glaucium luteum, now known to be fumaric acid.

glaucid (glå'sid), n. A gastropod of the family Glaucidæ.

glaucidæ. (glå'sid), n. pl. [NL., < Glaucus + -idæ.] A family of polybranchiate nudibranchiate gastropods, typified by the genus Glaucus. They have the body extended laterally into lobes terminating in linear appendages, the mouth armed with jaws, and the radula with uniserial teeth. The species chiefly harbor in floating algæ in the high seas.

Glaucidium (glå-sid'i-um), n. [NL. (Boie, 1826), < Gr. γλανκίδιον (dim. of γλανκο, a fish), taken as dim. of γλανκ-), an owl.] A genus of very small owls without plumicorns, with the facial disk imperfect, the tarsus feathered, the wings short, and the tail moderately long; the gnome-owls. glaze (glāz), n. [\langle glaze, v.] 1. A ritrifiable substance applied to the surface of fine pottery, stoneware, and porcelain. It is either a substance which can be applied directly to the biscuit in liquid form, or one, as common sait, the vapors of which, when it is

placed in the furnace with the ware, will affect the surface of the latter in the manner desired. Porcelain glaze is an example of the first kind, and is a sort of translucent glass which combines with the paste sufficiently to form a perfect union with it, but retains a slight thickness through which the paste is seen. Salt glaze is the commonest instance of the second variety. Also called couverts, covering, glazing.

Great confusion has been caused in various works on pottery by a careless use of the terms glaze and "enamel"; they are both of the nature of glass, but the best distinction to make is to apply the word "enamel" to a vitreous coating that is opaque, and the word glaze to one that is transparent; both may be coloured.

Encyc. Brit., XIX. 601.

It is no less certain that at all depths down to 2400 fathoms or thereabouts, Globigerinæ in all stages of growth and containing more or less protoplasmic matter are found at the bottom, mixed with the cases of the surface Diatoms and the akeletons of Radiolaria. The proportion of Globigerinæ, Orbulinæ, and Pulvinulariæ in the deep-sea mud increases with the depth, until, at depths beyond 1000 fathoms, the sea-bottom is composed of a fine chalky oose made up of little more than the remains of these Foraminifera and their associated Diatoms and Radiolaria.

as globigerina-mud.

If we suppose the globe to be uniformly covered with an ocean 1000 fathoms deep, the solid land covering its bottom would be out of the reach of rain, waves, and other sgents of degradation, and no sedimentary deposits would be formed. But if Foraminifera and diatoms, following the same laws of distribution as at present obtained, were introduced into this ocean, the fine rain of their silicious and calcareous hard parts would commence, and a circumpolar cap of silicious deposit would begin to make its appearance in the north and in the south; while the intermediate zone would be covered with globigerina coze, containing a comparatively small proportion of silicious matter. The thickness of the . . . beds thus formed would be limited only by time and the depth of the ocean. . . . The beds of chalk which underlie the nummulific limestone and occupy a still greater area are essentially identical with the globigerina coze, the species of Globigerina found in it being undistinguishable from those now living.

The family occurs from the Trias to the present day, and the remains of its individuals constitute much of the chalky mnd found at the bottom of the sea, as well as vast extents of limestone. Like other foraminifers, they were originally mistaken for and described as minute cephalopods, owing to the form of the chambered shells. But they are protosoan animalcules whose soft parts consist of apparently structureless protoplasm, like that of other foraminifers and of rhisopods in general, which has the power of secreting lime and building of this substance a

The Globigerinida are prominent, among many related forms of foraminifers, for the profusion in which they occur, their myriads having furnished the material for considerable of those parts of the earth's crust which consist of limestone. In this respect the globigerines resemble nummulites, but they are still in existence, and in the present formation of globigerinsmud at the bottom of the ocean is witnessed a process by which solid rock may be formed from the hard chalky shells of microscopic organiams whose soft parts have long since periahed. gloria (glo'ri-ä), n. [L., glory: see glory.] 1. In liturgics, the great doxology (Gloria in Excelsis) or the lesser doxology (Gloria Patri). See below.

I show myself demurely in my seat in the village church, owing at the Glorias, or kneeling with my face hid in my ands.

W. H. Mallock, New Republic, iv. 2.

I show myself demurely in my seat in the village church, bowing at the Gloria, or kneeling with my face hid in my hands.

W. H. Mallock, New Republic, iv. 2.

2. A musical setting of one of these doxologies.—3. In general, a doxology or ascription of praise.—4. In eccles. art, a glory: often incorrectly used for halo or aureole.—Gloria in Excelsia, the hymn or chant beginning in Latin with the words Gloria in Exclesia Boo (Glory in the highest to God), and in the English version with Glory be to God on high. The first two clauses are given in Luke ii. 14, as sung by angels; and both this shorter form, as sung in churches in early times and still in use in some Oriental offices, and the enlarged form are therefore known as the angelic hymn. In some Eastern liturgles it stands at the beginning of the eucharistic office. In Western rites it is found at the beginning of mass, after the introlt and kyrle, and before the collect, as in the Roman missal, and also in the Use of Sarum and in the Anglican Prayer-Book of 1549. In revisions of the Anglican Prayer-Book since 1552 it has stood at the end of the Communion Office, after communion and a prayer of thanksgiving. In the American Prayer-Book it is also an alternate to the Gloria Patri after the last pealm at Morning and Evening Prayer. In the Greek Church it is used after the psalms called lands (alvo) toward the end of the matin service, and at complin (awodenwov) after Psalm calli. Also called, especially in the Eastern Church, the great doxology.—Gloria Patri, the short hymn, "Gloria Patri, et Filio, et Spiritui Sancto. Sicut erat in principio, et nunc, et semper, et in secula seculorum. Amen.") This ascription has been used since very early times in both the Eastern and Western churches. Also called the lesser doxology.—Gloria Thi, the brief doxology—in Latin, "Gloria thi, Domine"; in the English version, "Glory be to thee, O Lord"—said after the announcement of the liturgical gospel in Roman Catholic and Anglican churches. In the Eastern Church the form is, "G

To be in one's glory, to be in the full gratification of one's pride, vanity, taste, notion, or hobby.—Syn. 1. Fame, Renown, Honor, Glory.—Fame is simply report, repute, whereby one is made widely known for what one is, does, etc.; it may be good or bad, and is thus essentially the same as celebrity: as, an evil fame attaches to all traitors. Henove expresses the same idea through the notion that one is named again and again by the same persons and continually by new persons; it may be bad, but is generally good. Fame may be a weak word, but renown is always strong. Honor is the least external of these words, indicating often only a respectful frame of mind toward another: as, to hold one in honor. The word, however, sometimes has the meaning of a wide and excellent fame. It is the only one of the series that means acts or words of tribute. Glory is supperlative fame or honor, but not necessarily of wide extent. See famous.

Ellis, intended to be used concurrently with the existing English orthography (which he calls Nomic, i. e., 'customary'), in order to remedy some of its defects without changing its alphabetic form or detracting from its value. It is based on the principle of uniformly using for each sound the letter or digraph that happens to be most commonly used for such sound in the existing orthography. The following are the vowel notations with their equivalents in the system of this dictionary, and such of the consonant combinations as differ from those of that system. An inverted period after a vowel marks it as accented.

glucose (glö'kōs), n. [⟨ Gr. γλυκύς, sweet, + -ose.] 1. The name of a group of sugars having the formula C₆H₁₂O₆, which may be regarded as aldehydes of hexatomic alcohols. They are less sweet than cane-sugar. One or more of them constitute the sugar of fruits, and they are produced from cane-sugar, destrine, starch, cellulose, etc., by the action of acids, certain ferments, and other reagents, and by processes going on in living plants. The two best-known varieties, distinguished by their action on polarized light, are destroglucose, destrose, or grape-sugar, which turns the plane of polarization to the right, and levoglucose, levulose, or fruit-sugar, which turns it to the left.

It is also employed by textile colorists, for the reason that its solutions are precipitated by tannic acid, and the precipitate so produced attracts many of the coal-tar colorisfrom their solutions. In this respect it serves as a fixing agent for the tannic acid; but as a nitrogenous albuminoid substance, it may at the same time act as a mordant. A kind of glue is made in Japan from Glacopetits intricate, which is used to stiffen thread, to cleanse and soften the hair, for painting on porcelain, and for attaching paper hangings to plastered walls.

Glyceria (gli-sē'ri-š), n. [NL., < Gr. γλυκερός, sweet, an extension of γλυκός, sweet.] A genus of grasses, closely allied to Poa and Festwoa. There are about 30 species, widely distributed through temperate regions, mostly in wet or swampy ground, and of little agricultural importance. The manna-grass, G. fusicans, grows in shallow water, its leaves often floating; its seeds are sometimes collected in Germany and used as an article of food under the name of manna-croup, furnishing a light nutritious aliment for invalida. The rattlemake-grass or tall quaking-grass, G. Canadensis, and the tall or reed meadow-grass, G. arundinacea, are tall and stout species of the United States.

Glyceridæ (gli-ser'i-dē), n. pl. [NL., < Glycera glycogen-mass (gli'kō-jen-mas), n. Same as epiplasm. + -idæ.] A family of errant chætopodous annelids, of the order Polychæta. They have a slender body composed of many ringed segments; the conical prestomium with two basal palps and four terminal tentacles; a protrusile proboscis with four teeth; and no special vascular system, the red hemal fluid being contained in the somatic cavity and branchial sacs.

glyceride (glis'e-rid or -rid), n. [⟨ glycer-in + -ide¹.] In chem., a compound ether of the triatomic alcohol glycerol or glycerin. Some of the glycerides exist ready formed, as natural fats, in the bodies of plants and animals, and many more may be produced artificially by the action of acid upon glycerol.

arthonically by the section of seed upon glyceroi. glycerin, glycerine (glis'e-rin), n. [$\langle Gr. \gamma \lambda v - \kappa e \rho c$, sweet, $+ - i n^2$, $- i n e^2$.] A transparent, colorless, hygroscopic liquid $(C_3H_5(OH)_3)$, with a less, hygroscopic liquid $(C_3H_5(OH)_3)$, with a sweet taste and syrupy consistence. It occurs in natural fats combined with fatty acids, and is obtained from them by saponification with alkalis or by the action of superheated steam. It is a triatomic alcohol, and disolves the alkalis, alkaline earths, and some metallic oxids, forming compounds analogous to the alcoholates. It is used in medicine as an emollient and protective dressing, with which, from its consistence and solvent properties, many substances can be incorporated; it absorbs watery discharges, and has some astringent action. The name is also applied to mixtures of glycerin with various substances, whether involving solution or not: as, glycerin of gallic acid; glycerin of starch. It is used in the arts for a great variety of purposes: for example, in soaps and cosmetics, for preserving animal and vegetable substances, in paper-making, and in the manufacture of nitroglycerin and dynamite. Also called glycerol, glycerole, glycerin and glycerin exament. See cement.

glycocholic (glī-kō-kol'ik), a. [ζ Gr. γλυκύς, sweet, + χολή, gall: see cholic, bile².] Derived from gall: used only in the following phrase.—Glycocholic acid, Coalla, NOa, the principal acid in orgali, occurring in combination with alkalis. It is a monobasic acid, forming crystalline needles soluble in water.

glycocin (glī'kō-kol), n. [ζ Gr. γλυκύς, sweet, + κόλλα, glue.] Amido-acetic acid (CH2.NH2. COOH), a substance having weak acid and also basic properties, formed when gelatin or various other animal substances are boiled with acids or alkalis. It is a crystalline solid having a sweetish taste. Also called glycin, glycocin, and gelatin sugar.

glycogen (gli kō-jen), n. [\langle Gr. γλυκύς, sweet, +-γενής, producing: see -gen.] 1. A substance, $C_6H_{10}O_5$, belonging to the carbohydrates. When pure it is a white, amorphous, tasteless powder, insoluble 161

in alcohol, soluble in water, and converted by boiling with acids into dextrose. Disatase converts it into dextrine, maltose, and dextrose. Iodine gives it a reddish-brown color. Glycogen is found in many animal tissues, both of vertebrates and invertebrates, as well as in certain fungi. It is especially abundant in the liver. It is largely if not wholly derived from the carbohydrates of the food, and appears to be a reserve material deposited in the liver, which is converted as required into sugar and so enters the circulation. Also called animal starch.

glycogenous (glī-koj'e-nus), a. [< glycogen + -ous.] Same as glycogenic.

relations between alcohol and glycerol, or the bodies of which these are the types. An alcohol contains but one hydroxyl group, OH, as C₂H₅OH, or ethyl alcohol; a glycol contains two hydroxyl groups united to different carbon atoms, as C₂H₄(OH)₂, ethyl glycol; a glycerol contains three hydroxyl groups united to three carbon atoms, as C₃H₅(OH)₃. Ethyl glycol is a liquid, inodrous, of a sweetlah taste, and miscible with water and alcohol.

Pertaining to a particular verse or meter, consisting of four feet, one of which is a dactyl, the others being trochees; composed or consisting of such verses: as, a Glyconic system. See II.

II. n. [l. c.] In anc. pros., a meter consisting in a series similar to a trochaic tetrapody catalectic $(\angle \cup |\angle \cup |\angle \cup |\angle)$, but differing from it by the substitution of a dactyl for the second trochee; by an extension of meaning, any lo-gaædic tetrapody, catalectic or acatalectic, in which three of the feet are trochees and one is a dactyl. A glyconic is called by recent metricians a first, second, or third glyconic, according as the dactyl is in the first, second, or third place. Glyconics seem to have been first used by Alcman (about 660 B. C.), and are frequent in Alcœus and Sappho. Nothing certain is known of the poot Glycon from whom this meter takes its name. glycerol, glycerole (glis'e-rol, -rol), n. [<

gneiss (nis), n. [(G. gneiss (as defined); said to be connected with OHG. gneista, etc., MHG. gneiste, etc., a spark: see gnast1 and ganister. Cf. the meaning of mica.] A rock which consists essentially of the same mineral elements are granite namely of thoclase, quartz, and mica. as granite, namely orthoclase, quartz, and mica, but in which there is a more or less distinctly foliated arrangement of the constituent ly foliated arrangement of the constituent minerals, and especially of the mica. It appears in a great variety of forms, and shows all stages of passage from true granite to a perfectly schistose condition, in which case the feldspar disappears, and the rock becomes a true mica schist. Porphyritic gneise is characterized by the presence of large distinct crystals or rounded kernel-like masses of feldspar. Gneise often contains hornblende instead of or associated with mica, and then receives the name of hornblendic or syenitic gneise. Some gneises are undoubtedly of eruptive origin; other varieties are admitted by most geologists to be metamorphosed sedimentary masses. As is the case with granite, so in gneiss the orthoclase is sometimes associated with plagioclase. See granits.

II. n. [cap.] A member of one of certain rationalistic sects which arose in the Christian church in the first century, flourished in the second, and had almost entirely disappeared church in the first century, flourished in the second, and had almost entirely disappeared by the sixth. The Gnostics held that knowledge rather than faith was the road to heaven, and professed to have a peculiar knowledge of religious mysteries. They rejected the literal interpretation of the Scriptures, and attempted to combine their teachings with those of the Greek and Oriental philosophies and religions. They held that God was the unknowable and the unapproachable; that from him proceeded, by emanation, subordinate detites termed cone, from whom again proceeded other still inferior spirits. The Gnostics were in general agreed in believing in the principles of dualism and Docetism and in the existence of a demiurge or world-creator. Chist they regarded as a superior con, who had descended from the Infinite God in order to subdue the god or eon of this world. Their chief seats were in Syria and Egypt, but their doctrines were taught everywhere, and at an early date they separated into a variety of sects.

After Christianity began to be settled in the world, the greatest corrupters of it were the pretenders to divine Inspiration, as the false Apostles, the Gnosticks, the Montanists, and many others.

Stillingflest, Sermons, II. Ii. Setting out from this principle, all the Gnostics agree in regarding this world as not proceeding immediately from the Supreme Being.

It was origneuter, and generally in the plural, being applied to the heathen deities, and elevated to the Christian sense upon the conversion of the Teutonic peoples. Popular etymology has long derived God from good; but a comparison of the forms (see good) shows this to be an error. Moreover, the notion of goodness is not conspicuous in the heathen conception of deity, spicrous in the heathen conception of deity, and in good itself the ethical sense is comparatively late.] 1. [cap.] The one Supreme or Absolute Being. The conceptions of God are various, differing widely in different systems of religion and metaphysics; but they fall, in general, under two heads: theim, which is most fully developed in Christianity, and in which God is regarded as a personal moral being, distinct from the universe, of which he is the author and ruler; and pantheim, in which God is conceived as not personal, and as identified with the universe. See theim, pantheim. [In this sense used only in the singular.]

Whether the Gr. χρυσός, gold, is cognate is doubtful; the L. word is different: see aurum. Hence gild¹, gilt¹, gilden¹, and ult. gilden², gulden.] I. n. 1. Chemical symbol, Au; atomic weight, 196.7. A precious metal remarkable on account of its unique and beautiful yellow color, luster, high specific gravity, and freedom from liability to rust or tarnish when exposed to the air. The specific gravity of pure gold is 19.8. Gold stands first among the metals in point of ducyellow color, luster, high specine gravity, and freedom from liability to rust or tarnish when exposed to the air. The specific gravity of pure gold is 18.8. Gold stands first among the metals in point of ductility and malleability. Its tenacity is almost equal to that of silver, two thirds that of copper, and twelve times that of lead. It may be beaten into leaves thin enough to transmit a greenish light. It stands next to silver and copper as a conductor of heat and electricity; its melting-point is about 1,100° C. (or 2,000° F.); it is not attacked by any of the ordinary acids, but combines readily with chlorin; and it is dissolved by a mixture of hydrochloric and nitric acids. The crystaline form of gold is isometric, but crystallized gold is a rarity, and it is extremely uncommon to finder sate with amooth faces and sharp edges. Neither have any very large crystals ever been noticed, nor one so much as an inch in diameter. Arborescent masses, showing irregularly developed crystalline planes, are occasionally found, and such forms are sometimes aggregated into large masses; but much the larger part of the native gold found is entirely destitute of any appearance of crystallization, being usually in the form of small scales, which are often so minute as to be almost invisible to the naked eye. Larger rounded masses, called nug-

gets, are cocasionally met with, and these are sometimes many pounds in weight. A specimen from the Ural preserved in the collection of the mining school at 8t. Petersburg weighs nearly a hundred pounds. The largest nugget of which there is any record was found in Australia, and was called the "Welcome." It weighed over 184 pounds, contained by assay 99.2 per cent. of gold, and netted a value when melted of \$46,625. Gold is a widely disseminated metal, but does not occur anywhere in large quantities, as compared with the ordinary useful metals. There is no proper ore of gold, this metal being never, so far as known, mineralized by sulphur or oxygen. Although gold is disseminated in fine and usually invisible particles through various ores of the other metals, and in many cases in quantity great enough to be separated with profit, most of the gold of the world is obtained either in the form of native gold, from washing the superficial detritus (sand and gravel), or by separating it from quartz, with which mineral it is almost invariably associated when occurring in veins or segregations in the solid rocks. Native gold is, however, in fact, an alloy of gold with silver, and traces of copper and iron are often associated with it. No native gold entirely free from silver has ever been found. The amount of the latter metal present in the gold varies greatly in different regions. The gold of California usually contains from 10 to 12 per cent. of silver; that of Australia rather less than half as much. The native gold of Mount Morgan, Queensland, approaches more nearly to chemical purity than any hitherto discovered, since it contains 99.7 per cent. of gold, and only a minute trace of silver. Pure gold is very rarely used in the arts. All gold coin and gold ornaments in use are alloys of gold with copper, or with copper and silver. The solo of for gold and 1 of copper: the so-called gold used for jewels and watch-cases varies from 8 or 9 to 18 carats fine. (See carat, 2.) The alloys of gold with copper and silver are

The rule for finding it is to add 1 to the number of the year after Christ, according to the ordinary reckoning, and divide by 19, when the remainder will be the golden number. The name is said to be derived from the fact that, on the discovery of the Metonic cycle, about 452 B. C., an inscription in letters of gold was set up in Athens, and others in other cities of Greece; the numbers were also marked in gold in the ancient calendars. The golden numbers are used in ecclesiastical computations, with the epact, to determine the day on which the Easter full moon occurs, the date by which all the movable feasts in the church year are determined. See Easter!—Golden rose, a rose made of pure gold, blessed by the Pope on Lestare Sunday, the fourth Sunday of Lent, used by him in blessing the people, and occasionally sent as a mark of especial honor to Catholic sovereigns and other notable persons, to churches, cities, etc. Originally it consisted of a single rose of wrought gold; the form finally adopted is a thorny branch with flowers and leaves, surmounted by one principal rose.—Golden samphire, saxifrage, shiner, etc. See the nouns.—Golden samphire, saxifrage, shiner, etc. See the nouns—Golden samphire, saxifrage, shiner, etc. See the noun

One of the paired pieces forming the external genital organs of insects. In the female they are appendages of the eighth and ninth ventral abdominal segments, which form the ovipositor or sting; in the male they are attached to the ninth or tenth segment and become the clasping-organs.

In the female (cockroach)... on the sternal region be-

come the clasping-organs.

In the female (cockroach), ... on the sternal region behind the vulva, between it and the anus, arises a pair of elongated processes, divided into two portions. ... They embrace and partly ensheath two other processes having somewhat the shape of knife-blades. ... Of these, which may be termed gonapophyses, the study of their development shows that the posterior blid pair belong to the ninth somite, while the anterior pair belong to the eighth. ... These plates and hooks [of the male cockroach] terminate processes of the sternal region of the tenth somite, on each side of the aperture of the vas deferens; and therefore though they are of the same nature as the gonapophyses of the female, they are not their exact homologues.

[NL., \(\sigma \) Gr. \(\gamma \) vor\(\eta_i \) generation, seed, \(+\) dim. term. \(\text{-idov.}\)] 1. In algol., a reproductive body produced asexually, as a tetraspore or zoöspore. By some authors the term is made to include also the sexual reproductive bodies of fungi and other cryptogams, being in this sense synonymous with conditum.

2. In bryol., a cell filled with granules. Braithwaite.—3. One of the green or chlorophylosering elements of lichens, usually occurring in the thalli in a distinct layer, but sometimes not definitely arranged. They are usually variously rounded ed cells, distinct or in chains or filaments, and multiply by fission. They were formerly supposed to be produced by the hyphe of the thallus at their tips; but some recent observers hold that they are formed endogenously in all parts of the lichen and its fruit; others believe that they originate entirely outside and independently of the lichen. The various forms of gonidia are found to resemble closely various forms of gonidia are found to resemble closely various forms of fresh-water alge. The Schwendenerian hypothesis asserts that the gonidia are alge, and that the fungoid part of the lichen is a fungus parasitic upon them. Several forms have been named, as follows: (a) Eugonidia, or gonidia proper, those having a pure chlorophyl-green color. They are subdivided into (1) haplogonidia, resembling Protoccus; (2) platygonidia, depressed and variously membranously connected gonidia; (3) chroolegogonidia or chrywogonidia, which contain orange granules; (4) conferrogonidia, resembling Conferos. (b) Gonidinia, smaller than gonidia proper, and intermediate between them and gonimia. They include hymenial gonidia. Hence gooseling, gosling, goshawk.] 1. Any bird of the family Anatidæ and subfamily Anserinæ, of which there are about 40 species of several genera, as well as different varieties of the domesticated bird. See phrases below. Geese are technically distinguished from swans and from ducks by the combinazansis, zāsis = Lett. zoss = Skt. hansa (> Hind. as different varieties of the domesticated bird. See phrases below. Geese are technically distinguished from swans and from ducks by the combination of feathered lores, reticulate taral, stout bill high at the base, and simple hind toe. The neck is shorter than in swans, and usually longer than in ducks; the sexes are usually similar, contrary to the rule among ducks. Geese stand higher and walk better than ducks; as a rule they are less decidedly aquatic and more herbivorous, the exca being more highly developed in consequence. Geese have a peculiar cry or call known as honking, and also utter a hissing sound. The flesh of most geese is highly esteemed. The tame goose in all its varieties is supposed to be descended from the graylag or common wild goose of Europe, A. ferus; but some other related species may have contributed to the domestic stock. The pure-white variety is entirely artificial, and not related to the snow-geese of the genus Chen. The male of the goose is called gender, and the young of either sex gosting.

A game of chance formerly common in England. It was played on a card divided into small compart-ments numbered from 1 to 62, arranged in a spiral figure around a central open space, on which, at the beginning of the game, the stakes were laid, and during the game any forfeits paid. It was played by two or more persons with two dice, and the numbers that turned up to each designated the number of the compartment by which he might advance his mark or counter. It was called the game of goose because at every fourth and fifth compartment in succession a goose was depicted on the card, and, if the throw of the dice carried the counter of the player on a goose, he might move forward double the actual number thrown. is forked, without spicules. Also Gordiadæ, Gordiaœa.

In the young stage they live in the body cavity of predatory insects, and are provided with a mouth. At the pairing time they pass into the water, where they become sexually mature. The embryos, which are provided with a circle of spines, bore through the egg membrane, migrate into insect larvæ, and there encyst. Water beetles and other predatory aquatic insects eat... the encysted young forms, which then develop in the body cavity of their new and larger host to young Gordiidæ.

It has 13 ribs. The tail is even more rudimentary than in man, having but 3 coocygeal bones instead of 4. The gorilla is also called the great chimpanzes, and is a near relative of the chimpanzes, Troglodytes niger or Anthropopithecus niger. It attains a height of about by feet, is found in the woody equatorial regions of Africa, is possessed of great strength, has a barking voice, rising when the animal is enraged to a terrific roar, lives mostly in trees, and feeds on vegetable substances. Gorillas make a sleeping-place like a hammook, connecting the branches of the sheltered and thickly leafed part of a tree by means of the long, tough, alender stems of parasitic plants, and lining it with the broad dried fronds of palms or with long grass. This hammock-like abode is constructed at different heights from 10 to 40 feet from the ground, but there is never more than one such nest in a tree. The animal was unknown to Europeans, except from vague report, until it was described in 1847 by Dr. T. S. Savage, an American missionary in western Africa. The first skeletons of the gorilla seen in Europe were brought by the American traveler Du Chaillu in 1859. The living specimens since brought to Europe and America have soon died.

The female is 23 or 24 inches long, the male smaller. The sexes are similar in color, slaty-blue on the upper parts, cross-barred below with dark color on a whitish ground, the wings and tail barred. The young are dark-brown above, streaked lengthwise below. This bird flies low, and pursues its prey in a line after it, or in the manner called "raking" by falconers. The female is generally flown by falconers at rabbits, hares, etc., and the larger winged game, while the male is usually flown at the smaller birds, principally partridges. The American goshawk is A. atricapillus, a larger and handsomer species than the European, very destructive to poultry, and hence commonly known as hen-hausk or chicken-hausk. The story of Christ's life, teachings, sufferings, death, resurrection, and ascension; hence, one of the books in which that story was originally told: as, the Gospel of Matthew. [Preferably with a capital letter when used in The gospels are four in number—those of Matthew, Mark, Luke, and John. Of these four, those of Matthew and John were written by apostles and eye-witnesses, that of Luke is avowedly gathered from others who were witnesses, and that of Mark has been from a very early age believed to be written by a disciple of the apostle Peter. The first three gospels are known as the synoptic gospels, because combined they present a general and harmonized view of Christ's life. The Johanniae origin of the fourth has been much disputed. Matthew and Mark confine themselves chiefly to Christ's ministry in Galilee; Luke adds an account of his ministry in Peres; John alone records his ministry in Judea, except that portion of it connected with the Passion. There are also aporryphal gospels which are not regarded as genuine by any scholars, either Protestant, Roman Catholic, or Greek. The more important of these are: the Gospel of the Birth of Mary, an account of Mary's birth, youth, and espousals; the Pro-snangelion, a somewhat similar account; the Gospel I and II, of the Infancy of Jesus Christ; and the Gospel of Nicodemus, also called the Acts of Ponitus Pilate, being an account of the crucifixion of Christ and his experiences in Hades.

5. A portion of Scripture taken from one of the four gospels, and appointed to be read in liturgical churches as a part of the church service. The gospel is the last and principal of the two or more eucharistic lections in all liturgies. In the Western churches the portions are selected with reference to their appropriateness to the day or season; in the Eastern they are read in consecutive order except on special festivals. In ancient times the gospel was read in the West, as in the East, from the ambo, sometimes from a distinct ambo of its own, later from a desk on an elevated place between nave and choir, called the "pulpit" (pulpitum), which developed as it was made more and more lofty, into the road-loft or jube. In later times it was read from a lectorn on the floor of the sanctuary, or from the north side is the right hand of the altar crucifix, or of the priest, if he stands in the middle and faces the people. The north side is therefore called the gospel side of the altar, and in Latin this side, or, more strictly, the corner beyond it, is termed gospels to a deacon, at the celebration of the holy communion, is called the gospeler, from his function of reading the gospel. Gossypium (go-sip'i-um), n. [NL., < L. gossypion, gossipion, also called gossympinus, the cotton-tree; the word has a Gr. semblance, but is prob. of Eastern origin.] A malvaceous genus of herbs and shrubs, natives of the tropics, and important as yielding the cotton of commerce. They have usually 3- to 5-lobed leaves, showy axillary flowers surrounded by 3 large cordate bracts, and a 3- to 5-celled capsule, the seeds densely covered by long woolly hairs. Four species are generally recognized, though many others have been proposed. The cultivated species are natives of Asia and Africa, where they have been pinnted from very early times, and many varieties have been produced. All the cotton manufactured in civilized countries is the product of several varieties of G. herbacsum and G. Barbadense, but G. arborsum is also cultivated in some tropical regions. The fourth species, G. Davidsonii, is native upon the western coast of Mexico, and is remarkable in having its seeds wholly naked; it is known only in a wild state. See cotton¹ and cotton-plant.

One of an ancient Teutonic race which appeared in the regions of the lower Danube in the third century gions of the lower Danube in the third century A. D. A probable hypothesis identifies them with the Gothones or Guttones who dwelt near the Baltic; but there is little reason to believe in their relationship with the Getze or in their Scandinavian origin. They made many inroads into different parts of the Roman empire in the third and fourth centuries, and gradually accepted the Arian form of Christianity. The two great historical divisions were the Visigoths (West Goths) and the Ostrogoths (East Goths). A body of Visigoths settled in the province of Mœsis (the present Servis and Bulgaria), and were hence called Mœsegoths; and their spostle Wulfilas (Ulfilas) translated the Scriptures into Gothic. The Visigoths formed a monarchy about 418, which existed in southern France until 507 and in Spain until 711. An Ostrogothic kingdom existed in Italy and neighboring regions from 488 to 555. By extension the name was applied to various other tribes which invaded the Roman empire. I am here with thee and thy goats, as the most canri-

Yearlous other tribes which invaces as the most caprilous poet, honest Ovid, was among the Goths.

3. An epithet commonly applied to the Euros. An epitnet commonly applied to the Euro-pean art of the middle ages, and more particu-larly to the various Pointed types of archi-tecture generally prevalent from the middle of the twelfth century to the revival of study of classical models in the fifteenth and sixteenth classical models in the fifteenth and sixteenth centuries. This epithet was originally applied in score (compare def. 2), by Italian Bensissance architects, to every species of art which had existed from the decay of Boman art until the outward forms of that art were revived as patterns for imitation; but, although no longer used in a depreciative sense, the adjective is inappropriate as applied to one of the noblest and completest syles of architecture ever developed, which owes nothing whatsoever to the Gotha, and is seldom now described as Gothic in other languages than English. See medical and Pointed.

The roof had some non-descript kind of projections alled bartisans, and displayed at each frequent angle a neal turret, rather resembling a pepper-box than a Gothic atch-tower.

Scott, Waverley, viil.

The principle of Gothic building, that every part, including what might seem at first sight as mere ornament, should have a constructive value, was never adopted by Italian builders.

C. E. Norton, Church-building in Middle Ages, p. 186.

4. In liturgics, an epithet sometimes applied to the Mozarabic liturgy, or to the Gallican family of liturgies, in accordance with an in-correct theory that they were first introduced into Gaul and Spain by the Visigoths, or from the fact that they were in use in Gallican and Spanish churches at the time of Gothic domination. An ancient manuscript of the Gallican liturgy still extant is entitled a Gothic Missal (Missale Gothicum)

nation. An ancient manuscript of the Gallican liturgy still extant is entitled a Gothic Missel (Missele Gothicum) by a later hand.

II. n. 1. The language of the Goths. The Goths spoke various forms of a Teutonic tongue now usually classed with the Scandinavian as the eastern branch of the Teutonic family, though it has also close affinities with the western branch (Old High German, Anglo-Saxon, etc.). All forms of Gothic have perished without record, except that spoken by some of the western Goths (Visigoths), who at the beginning of the fourth century occupied Dacia (Wallachia, etc.), and who before the end of that century passed over in great numbers into Mosis (now Bulgaria, etc.). Revolting against the Roman empire, they extended their conquests even into Ganl and Spain. Their language, now called Massopothic or simply Gothic, is preserved in the fragmentary remains of a nearly complete translation of the Bible made by their bishop, Wulfila (a name also used in the forms Ulfila, Ulfila) (who lived in the fourth century a. D.), and in some other fragments. These remains are of the highest philological importance, preceding by several centuries the next earliest Teutonic records (Anglo-Saxon and Old High German). The language bears a primitive aspect, indicating its existence under practically undisturbed linguistic conditions for a long period before its appearance in the records. Apart from the Latin and Greek words introduced with Christianity, Gothic shows little trace of foreign influence except in the presence of a few words borrowed from the neighboring Slava. As the oldest recorded Teutonic tongue, and usually but not always nearest the original Teutonic type, it stands at the head of the languages of its class, to which it bears a relation like that of the Sanskrit to the other languages of the Indo-European family.

2. In bibliography, an early form of black-faced and pointed letters, as shown in printed books and manuscripts.—3. [l. c.] The American name for a style of square-cut printing-type wit without serifs or hair-lines, after the style old Roman mural letters. 3. In gram., to cause or require to be in a particular form: as, a transitive verb or a preposition governs a noun or pronoun in the objective tion governs a noun or pronoun in the objective case; the possessive case is governs by the thing possessed; the subject governs the verb in number and person. —Syn. 1 and 2. Ruls, Control, Govern, Regulate, Manage; conduct, supervise, guide; command, sway, curb, moderate. Of the first five words, rule is the most general, and is the only one that can stand for the exercise of an arbitrary or a loose kind of sway. Control implies a firm rule, which may not attend to the details of administration, but holds persons in check and prevents things from going in a way not desired: as, to control expenditures; to control ferce tribes. Govern implies the constant use of knowledge and judgment, like the close attention given by a pilot to his wheel. To regulate is to bring under rules, hence to make exact; it is not ordinarily used to express continued action, but it may mean to keep under rule: as, to regulate a watch, one's movements, one's conduct, the administration of a province. Manage enlarges the notion of handling a horse or caring for the affairs of a household to greater things, as a ship, a business, a nation; it implies great attention to details, constant watchfulness, and much skill or at least adroitness; it is rather a small word to be used as a synonym for govern. See guide, v. t., and manage.

5. A father; a master or superior; an employer; an olderly person. [Slang.]—6. In mach., a self-acting regulator which controls a supply of steam, gas, or water; especially, any device for automatically regulating the amount of power developed in a machine, as in a steam power developed in a machine, as in a steamengine. Governors are made in a variety of forms and
with different methods of action. A form of governor
for the steam-engine which illustrates well the general
function of such devices is shown in the annexed figure.
It represents a spindle kept in motion by the engine. A
and B are two centrifugal balls, C A and C B the rods which
suspend the balls, crossing each other and passing through
the spindle at C, where
the whole is connected by a round pin put
through the spindle
and the rods, and
serving as the point
of suspension for
the centrifugal balls
or revolving pen-

revolving

the centritugal balls or revolving penduluma. A piece of brass, M, is fitted to alide up and down upon the upper part of the spindle, and to this piece the end of the lever NO, whose fulcrum is at P, is attached. This piece of brass is also connected with the ball-rods by two short pieces and joints, D E, F G. When the engine goes too fast, the balls if yurther asunder and depress the end N of the lever, which partly shuts a throttle-valve connected with the end O, and thus diminishes the quantity of steam admitted into the cylinder; and on the other hand, when the engine goes too slowly, the balls fall down toward the spindle and elevate the end N of the lever, which opens the throttle-valve wider, and increases the quantity of steam admitted into the cylinder; thus causing it to be proportioned to the resistance of the engine, and keeping the variation of velocity within narrow limits. A similar contrivance is employed in mills to equalize the motion of the machinery. When any part of the machinery is suddenly started or checked, and the moving power remains the same, an alteration in the velocity of the mill will take place, which alteration the governor serves to limit. See gus-governor.—Atmospheric, chronometric, etc., governor. See the adjectives.—Riectric governor, in mach.: (a) A governor in which the spread of revolving balls or the spread of the rim of a wheel by centrifu-

gal action may act as a circuit-closer and sound an alarm or control some other part of the mechaniam. (b) The regulator used in arc-lamps to control the current. See regulator.—Governory Art, as English statute of 1809 (i) and 18 Villiam III. The act of inserting a shoot or scion taken from one tree into the stem or some other part of another, in such a manner that they unite and produce fruit of the kind belonging to the tree from which the scion was taken. The methods of grafting are of great variety, designated by the words whip, splies, cleft, saddle, crown, etc. In whip-grafting, or tongue-grafting, the stock and scion, of

Cleft-grafting.

equal size, are fitted together by tongues cut in each, and tightly bound (whipped or lashed) until they are well united in growth. Spice-grafting is performed by cutting the ends of the scion and stock completely across in an oblique direction, in such a way that the sections are of the same shape, then laying the oblique surfaces together so that the one exactly fits the other, and securing them by tying or otherwise. In cleft-grafting the stock is cleft down, and the graft, cut in the shape of a wedge at its lower end, is inserted into the cleft. In saddle-grafting the end of the scion, allt up or cleft for the purpose, is affixed. Croungrafting, or rind-grafting, is performed by cutting the lower end of the scion in a aloping direction, while the head of the scion is inserted in the top of the slit between the alburnum and the inner bark and pushed down in order to raise the bark, so that the thin end of the scion may be introduced without being bruised; the edges of the bark on each side are then brought close to the scion, and the whole is bound with matting and clayed.

By Joseph, according to one account, it was carried to Britain. Other accounts affirm that it was brought by angels from heaven and intrusted to a body of knights, who guarded it on the top of a mountain; when approached by any one not perfectly pure it vanished from sight. The grail having been lost, it became the great object of search or quest to knights errant of all nations, none being qualified to discover it but a knight perfectly chaste in thought and act. The stories and poems concerning Arthur and the Knights of the Round Table are founded on this legend, and it has been still further developed in modern times. See sangreal.

And champing golden grain, the horses stood Hard by their chariots waiting for the dawn. Tennyson, Iliad, viii. 560.

3. The smallest unit of weight in most systems, originally determined by the weight of a plump

grain of wheat. In a pound troy or apothecaries' weight there are 5,760 grains, the grain being the 24th part of a pennyweight in the former and the 20th part of a scruple in the latter. The ounce of each therefore contains 480 grains, while in avoirdupois weight, in which the grain is not used, the ounce is equal to 4874 grains and the pound to 7,000 grains. Abbreviated gr.

4. Any small hard particle, as of sand, gunpow-

der, sugar, salt, etc.; hence, a minute portion of anything; the smallest amount of anything: as, he has not a grain of wit.

And for no carpyng I couth after ne knelyng to the grounde, I myste gete no greyne of his grete wittis.

Gralls (gral'ē), n. pl. [L., stilts, pl. of "gralla, contr. of "gradla, (gradi, go, walk: see grade'l.]

1. The fourth Linnean order of birds; the

waders, including forms now dispersed in several orders.—2. In Merrem's classification, the waders, including forms now dispersed in several orders.—2. In Merrem's classification, the larger and chiefly altricial grallatorial birds, such as herons, ibises, storks, and spoonbills, and also precocial forms, such as the cranes.

—3. An ordinal or other group of wading birds, variously restricted. The term has been transmitted from a former stage of ornithology, and no one has succeeded in defining it with precision. It is often discarded, the waders that had been placed in it being then distributed in three groups, called Limicolas, the precoccial shore-birds; Herodiones, the altricial waders, as herons, storks, and ibles; and Alectorides or Paludicola, the precoccial wading birds, like cranes, rails, and their allies. When the name Grallas is retained, it usually covers the first and third of these groups, and may be briefly said to correspond to the precoccial wading birds. These are an extensive and varied series of about 20 families. The plovers, Charadriidæ, and the snipes, Scolopacidæ, are the largest of these families; and more or less nearly related to these schizorhinal charadriomorphs are the Chionididæ, or aheathbills; the Thinocoridæ, or lark-plovers; the Gureotidæ, or pratincoles; the Dromadidæ, or crabplovers; the Hæmatopodidæ, or oyster-catchers; the Jacanidæ or Parvidæ, the jacanas; the Recurvivostridæ, or avosets and stilts; and the Phalaropodidæ, or phalaropes. A pair of holorhinal families of Grallæ are the Œdicuencidæ, or thick-knees, and the Otididæ, or bustards. The remarkable gralline genera Eurypyga, Rhinochetus, and Menites are types respectively of three families. The remaining præsocial gralline families are the Gruidæ and Rullidæ, or cranes and ralls, with which are now associated the Aramidæ, Psophidæ, and Cariamidæ. See the family names.

garnet1, and pomegranate.] 1. A rock composed of orthoclase-feldspar, mica, and quartz, and having a thoroughly crystalline-granular texture. While orthoclase is an essential constituent of true granite, triclinic feldspars are often present in smaller quantity. The mica is sometimes white or silvery (nuscovite), and sometimes dark-brown or even black (biotite). Both varieties are occasionally present together, and some lithologists call only that variety true granite in which both are present. While granite is a thoroughly crystalline rock, distinctly formed crystals of the component minerals are rarely seen in it, except on the walls of cavities. The color of granite is somewhat varied, although in much the larger number of cases the predominating tint is a light gray; some varieties, however, are almost as white as white marble; others are of a light-red or a pink color, which tint is due to the predominance of a rose-colored feldspar. Some varieties of granite are very massive and homogeneous in texture; hence this rock can often be quarried in blocks of large size. Granite is much used for building purposes where massiveness and durability are the chief requisites. It resists very poorly, however, the action of fire, fisking off and crumbling under the influence of heat. Many varieties take a fine polish, and are used for interior decration and for monumental work. Its hardness and coarseness of texture make it unfit for statuary. The theory of the origin of granite, and its relations to the distinctly straified rocks on the other, have long been subjects of discussion among geologists. Granite has often been called a "Plutonic" rock, to express the idea generally held by geologists that it has become consolidated at considerable depth below the surface, not having been poured out of a volcanic orifice like lava. Among the rocks ordinarily designated as granite by quarrymen and others there are many varieties, with a correspondingly varied scientific nomenclature. Of these varieties and freispar scattered

granulating-machine (gran'ū-lā-ting-mashēn'), n. A machine used to reduce some substance to the form of grains. Specifically—(a) In powder-making, an apparatus for breaking up the powder-cake into grains of various sizes. (b) An apparatus for reducing liquid metals to fine grains. It consists of a horizontal disk of terra-cotta made to revolve rapidly, upon which the liquid metal falls and is then scattered in every direction, centrifugally, into the air or into water, in a finely granulated condition.

granulation (gran-ū-lā'shon), n. [= F. granulation = Sp. granulacion = Pg. granulacio = It. granulazione; as granulate + ion.] 1. The act of forming into grains; the state or process of being formed into grains: as, the gr tion of gunpowder or sugar.

Granulation is the process by which metals are reduced to minute grains. It is effected by pouring them, in a melted state, through an iron cullender pierced with small holes into a body of water, or directly upon a bundle of twigs immersed in water. In this way copper is granulated into bean-shot, and silver alloys are granulated preparatory to refining.

Ure, Dict., 11. 734.

2. In surg. pathol.: (a) The formation of new tissue, as in the repair of wounds, the free surface of which presents a granulated appearance. This tissue is called granulation tissue. (b) Any one of the small granular elevations on the free surface of granulation tissue.

Tents in wounds, by resisting the growth of the little granulations of the fiesh, in process of time harden them, and in that manner produce a fistula. Sharpe, Surgery.

3. In med. pathol., the formation of small grain-like bodies or tubercles in the substance of an organ, as in tubercular phthisis.—4. In zoöl. and bot.: (a) A roughening of a surface with little tubercles like grains, or a surface so studded. (b) One of the little elevations in a granulated surface. ded. (b) One of the fittle elevations in a granulated surface.—Granulation corpuscles. Same as granula-cells.—Granulations of the cyclids, minute outgrowths of lymphoid tissue on the inner surface of the cyclids.—Granulation tissue, such tissue as grows in wounds, repairing the loss of substance, and formed from connective tissue or emigrated white blood-corpuscles. It consists of numerous cells, with more or less incredibling substance permeated by numerous thin-walled blood-vessels.

granule-cells (gran'ūl-selz), n. pl. Round cells densely crowded with fat-globules, found in areas of softening in the brain. Also called granule-corpuscles, Gluge's corpuscles, compound granular corpuscles, and granulation corpuscles. granuliferous (gran-ū-lif'e-rus), a. [< LL. granulum, a little grain, + L. ferre = E. bear¹.]

Bearing or producing granules or granulations. granuliform (gran'ū-li-fôrm), a. [< LL. granulum, a little grain, + L. forma, shape.] 1. In mineral., having a granular structure.—2. In bot., granular.

granulite (gran'ū-lit), n. [< granule + -ite².]

A rock often having a parallel or foliated structure like that of gneiss, and consisting mainly of quartz and feldspar, together with red garnets, which are usually of very diminutive size. The feldspar appears to be a mixture of orthoclase and oligoclase, the latter more generally predominating. Granulite is a rock of especial importance in Saxony. It is nearly the equivalent of the French curite, and is sometimes called in German Weissetein. See granute. 1.

granulitic (gran-ū-lit'ik), a. [< granulite + -ic.] Pertaining to granulite; of the nature of granulite: as, granulitic rock.

The rocks may be classed under three heads:—(1)... (2) the light-banded granulitic gneisses or Wittahire type.

The heathen philosopher, when he had a desire to est a grape, would open his lips when he put it into his mouth; meaning thereby, that grapes were made to est, and lips to open.

Shak., As you Like it, v. 1.

2. The vine which produces this fruit; the grape-vine. The cultivated grape of Europe, whether it be for wine or for table use, is the Vitix vinifera, of which there are said to be 1,500 varieties. The more common native species of the United States are the chicken, frost, or winter grape, V. covifolia, the fruit of which is small, very sour, and worthless; the riverside grape, V. riperia; the northern fox or plum grape, V. Labruxa; the southern fox, bullace, muscadine, or scuppernong grape, V. vulpina or rotundifolia; and the summer grape, V. vulpina or rotundifolia; and the summer grape, V. vulpina or rotundifolia; and the summer grape, V. vaticalis. The numerous cultivated table-grapes of the eastern United States are either varieties of these (as the Concord, Catawba, Isabella, Hartford Prollife, etc., derived from V. Labrusca, and the Clinton, from V. riparia), or hybrids of these with each other or with varieties of V. vinifera (as the Delaware, Niagara, Taylor, etc.). The most successful wine-grapes are for the most part varieties of V. vinifera (as the Delaware, Niagara, Taylor, etc.). grape-mildew (grāp'mil'dū), n. A fungous disease of the grape. The American or downy mildew is Peronospera viticola, which appears in white, downy patches, chiefly on the under surface of the leaves, producing brown spots on the opposite surface. It also occurs on young stems and fruit. The fructification of the fungus consists of conidia borne upon sparingly branched pinnate condidophorea, and obspores embedded in the leaf. (See cut under condidum.) It has been very destructive in North America, and more recently in southern Europe. The old European grape-mildew is Ordium Tuckeri, in which only the condial fructification is known, the condia being borne in a single chain on simple condidophorea. The powdery grape-mildew of America is Uncinula spiralia, one of the Erysiphew in which the mycelium is spread over the whole upper surface of the leaf, but does not enter its tissues, and the fructification consists of minute cleistocarpous conceptacles containing asci and spores.

grape-rot (grāp'rot), n. Any disease of grapes which results in the decay of the berry. The black-rot fungus is Phona uvicola, which causes the grapes to shrivel and turn blackish. It forms numerous pustules just beneath the surface, which are conceptacles containing spores. In America this is the most destructive rot. The white rot is caused by Conichyrium diplodically. When Peronospora viticola stacks the berries, the resulting decay has been called brown rot. A recently discovered fungus (Greeneria fuliginea) is said to produce bitter rot.

grape-shot (grāp'shot), n. A projectile discharged from a cannon, having much of the destructive spread of case-shot with somewhat of the range and penetrative force of solid shot. A round of grape-shot consists usually of nine cast iron balls, in three tiers, arranged between parallel iron disks connected by a central iron pin. In quilted grape-shot the balls are placed on a circular fron stand round an upright iron spindle, and are secured by a stout canvas covering fastened to the bottom plate and quilted over the balls by marlins, the upper edge of the canvas being tied round the spindle.

5. Working by drawings to scale instead of by arithmetical calculations.—6. Concerned with position, not with measurement.—Graphical geometry. See geometry.—Graphical method. (a) In math, any method of representing the relations of objects by means of the relations between the parts of a diagram. Such a method is employed, (1) in order to convey information, as when parallel lines of different length are exhibited which are proportionate to the population, etc., of different countries; and (2) to aid numerical or logical calculations, as when a curve is drawn through points whose coordinates represent the population of a country at successive decadal epochs; and this curve is used to ascertain the population at other dates. Graphical methods are of three kinds: those which make no use of the continuity of space except to show that the extremities of lines are connected, and of this kind are graphs; those which use only the projective properties of space; and those which use the metrical properties of space; and those which use the metrical properties of space, and which produce diagrams intended to be measured. Of the last kind, for example, are the graphical methods of statists, etc. (b) In pathol., a mode of studying diseases of the heart and the great vessels by tracings of an instrument, as the sphygmograph. graphite¹ (graf'it), n. [= F. graphite, so called from its use in making pencils for writing, \(\) Gr. \(\gamma \rho \rho h \), writing, \(+ \cdot i t \). One of the forms under which carbon occurs in nature (see carbon), also known as plumbago and black-lead. It has an irongray color and metallic luster, and occurs in foliated masses and embedded scales. It is soft and unctuous to the touch, makes a black shining streak on paper, and is used chiefly in the manufacture of pencils, crucibles, and portable furnaces, for burnishing iron to protect it from rust, and for counteracting friction between the rubbing surfaces of wood or metal in machinery. It is a conductor of electricity, and in the form of a powder is used for coating the non-conducting surfaces of molds in making electrotypes. The most important regions supplying graphite are the Alibert mine in Siberia, which furnishes the best material for lead-pencils, and Ceylon, whence comes a large part of the coarser material used for stove-polish and for lubrication. There are also extensive mines of graphite near Lake Champlain.—Gas-graphite. Same as gas-carbon (which see, under carbon).

3. Feeling kindly or tenderly on account of a favor or favors bestowed; disposed to acknowledge and repay benefits.

My life has crept so long on a broken wing . . . That I come to be grateful at last for a little thing.

Tennyson, Maud, xxviii.

=Byn. 3. Grateful, Thankful, beholden. Grateful is preferred when we speak of the general character of a person's mind: as, a man of a grateful disposition; an ungrateful wretch. Grateful often expresses the feeling, and the readiness to manifest the feeling by acts, even a long time after the rendering of the favor; thankful refers rather to the immediate acknowledgment of the favor by words. The same distinction is found in the negative forms, ungrateful, unthankful, thankless. Thankful is often loosely used for relieved or glad, where the thanks, if rendered, would be given to a merciful or helping Providence: as, I am thankful for my escape.

Sw. gravitation = F. gravitation = Sp. gravitacion = Pg. gravitacion = It. gravitatione, < NL. *gravitatio(n-), < *gravitare, gravitate: see gravitate.] 1. The act of gravitating or tending toward a center of attraction.—2. That attraction between bodies, or that acceleration of one toward another, of which the fell of heavy bodies to the earth is that acceleration of one toward another, of which the fall of heavy bodies to the earth is an instance. See gravity, 1. Gravitation can be neither produced nor destroyed; it acts equally between all pairs of bodies, the acceleration of each body being proportional to the mass of the other; it is neither hindered nor strengthened by any intervening medium; it occupies no time in its transmission; its force is inversely as the square of the distance; and the amount of it is such that a particle distant one centimeter from an attraction in 40 minutes and 20 seconds. Inasmuch as the masses of bodies can be measured otherwise than by their weights, namely, by their relative momentums under a given velocity, it follows that the modulus of gravitation, or the amount by which the unit mass attracts a particle at the unit distance, which is invariable, best disquishes gravitation from every other force. The laws of the attraction of gravitation were demonstrated by Sir Isaac Newton in 1687.

Weight, as contradistinguished from mass; precisely, the downward acceleration of terresprecisely, the downward acceleration of terrestrial bodies, due to the gravitation of the earth modified by the centrifugal force due to its rotation on its axis. The amount of this acceleration is

about \$25.1 inches (978 centimeters) per second at the sealevel and the equator, while at the poles it is \$87.1 inches. Gravity is a little less on mountains than at the scalevel, in the proportion of a diminution of one thousandth part at every two miles of elevation. There are also other alight variations of gravity, from which the figure of the goold (which see) can be calculated. Generally speaking, gravity is in excess where the radius vector of the goold is in excess of that of the mean spheroid. [The words gravity and gravitation have been more or less confounded; but the most careful writers use gravitation for the attracting force, and gravity for the terrestrial phenomenon of weight or downward acceleration which has for its two components the gravitation and the centrifugal force at the equator is gravity. It is everywhere exerted in the plane of the meridian at right angles to the direction of the celestial pole. The direction of gravitation in middle latitudes is inclined about 11'.5 to the radius of the earth.

—Line of direction of gravity, the line drawn through the center of gravity of a body in the direction in which gravity tends to move it; the line along which the center of gravity would begin to fall if the body were free.

—Specific gravity, the ratio of the weight of a given bulk of any substance to that of a standard substance. The substance taken as the standard is water for solids and liquids, air or hydrogen for gases. The weights of bodies being proportional to their masses, it follows that the specific gravity of a body is equivalent to its relative density, and the term density has nearly displaced specific gravity in scientific works. As long as the term specific gravity in scientific works. As long as the term specific gravity in scientific works. As long as the term specific gravity was in use, water at 62° F. was taken as the standard if great accuracy is required, corrections must be made for temperature and for the buoyancy of the air. Thus, if we take equal bulks of water, silver, and platinum, and weigh them, the silver will be found to be 10.5 times and the platinum 21.4 times heavier than the water; and reckoning the specific gravity of silver is said to be 10.5, and that of platinum 21.4. A common method of obtaining the specific gravity of silver is said to be 10.5, and that of platinum 21.4. A common method of obtaining the specific gravity of silver is said to be 10.5, and that of platinum 21.4. A common method of obtaining the specific gravity of silver is said to be 10.5, and that of platinum 21.4. A common method of obtaining the specific gravity of the body. from one another the different minerals of which rocks are composed, by taking advantage of their differences of specific gravity. The method is analogous to the process of ore-dressing, which is a separation of minerals differing in specific gravity in the large way, the fluid used being water. The essential difference, however, is that the fluid used by the lithologist is varied in specific gravity, by dilution, to just the desired conditions, while the water, of course, remains always the same when used by the ore-dresser. The idea of using a gravity-solution in lithological research originated with Thoulet in 1879. The fluid which he used was a solution of the iodide of mercury in iodide of potassium, having a density of 2.77 at 57° F. Several other solutions having a higher specific gravity have since that time been used. See specific gravity, under gravity.

little or no distinctive hue (chroma) and only moderate luminosity. If only about 5 per cent of the light is reflected, the surface is called black; if as much as 50 per cent, is reflected, it is called boltes. Pure gray has a slightly bluish appearance, owing to contrast with the color of brightness which enters into the sensation produced by white light. A small admixture of red with gray light makes the modified gray called sakes of roses. A small amount of green light mixed with gray is not noticed, and if the mixture is placed in juxtaposition with pure gray, the latter looks pinkish by contrast, while the former appears of a neutral tint. A larger admixture of green will give a mouse-gray (which properly requires the green to be yellowish), a still larger amount an olive gray, and still more a sage green. The effect of the admixture of violet blue is singularly dependent upon the shade of gray; if it is quite light, the result is a lilac gray or full

lilac, or may be even too purple for lilac, while if the gray is darker a french gray or slate-gray results, which needs the addition of red to give lavender gray, although the latter appears bluer than lilac gray. If yellow is mixed with gray, the result is a stone gray or drab gray, or in larger admixture a full drab. All these remarks refer to mixtures of lights, not to mixtures of pigments, the effects of which depend upon the special absorption-spectra of the pigments, and can only be ascertained by direct experiment.

(b) The corresponding season of the church year, from Easter to Ascension.—The Great Hogul. See Mogul, and def. 7.—To be great fun. See fun.—Byn. 1 and 2. Great, Large, Big. Great is a very general word, as may be seen by the definitions; it covers extent, number, and degree. Large expresses greatness in at least two dimensions, and is not so free in secondary uses; hence we speak of a large room, picture, or apple, but not of a large noise, trouble, or distance. Big is sometimes essentially the same as great, but it often suggests bulkiness, weight, clumsiness, or less of

dignity than is implied in great or large: as, a big boy; a big ship.

Nobody can be great, and do great things, without giving up to death, so far as he regards his enjoyment of it, much that he would gladly enjoy.

1. Armor, made of metal, and lined with some soft substance, worn to protect the front of the leg below the knee. In ancient Greek examples the greaves were of thin metal fitted to the shape of the legs, which they inclosed almost completely, and were held in place by the elasticity of the metal clasping the leg. In medieval armor the greaves were often an additional defense, as of cuir-bouilli or of forged steel, worn over the chause of mail or gamboised work. See bainberg and jambe, and first cut under armor, fig. 2. Rarely used in the singular.

ward position of the legs. Because of the apparent absence of a tail, and the singular ruffs or crests, the aspect of these birds is peculiar. They nest in ponds, lakes, and rivers, generally building among reeds or rushes, and lay several, usually 6 or 8, elliptical whole-colored eggs. One of the best-known species is the common datchick of Europe, Podiceps or Sylbsocyclus minor. The grebe known in America as the dabehick is Poditymbus podiceps. The largest is the spear-billed or western grebe, Rehmophorus occidentalis, peculiar to western North America. (See cut under Rehmophorus.) The great grebe is a conspicuously crested species of the old world, Podiceps cristatus. The European red-necked grebe is P. griedgena, a variety of which, P. holboelis, also inhabits North America. The Slavonian or horned grebe, P. cornutus, is common in most parts of the northern hemisphere; the eared grebe, P. curitus or nigricollis, is closely related to it. Some of the grebes reach 2 feet in length, but most of them are much smaller. The plumage of the breast is of a beautiful silvery luster and satiny texture, and is much used to ornament ladies hats, for muffs, etc. Grebes have many local popular names, as arse-foot, dabchick, didapper, dipper, dopper, helidioer, and vaterwitch.

Greco-Roman (gre'kō-rō'man), a. Of or pertaining to both Greece and Rome, as the Latin civilization after it had become modified by contact with the higher civilization of Greece, and specifically the art cultivated under Roman domination, almost exclusively by Greek man domination, almost exclusively by Greek artists. Greo-Roman art can be traced back as far as the fifth century B. c., but did not acquire extensive development before the Roman spoliations of Greece began in the second century. Greek sculpture at Rome retains the general characteristics of the later Hellenistic work (see Pasitelean); and Roman sculpture became most nearly a national school in its portraits and historical reliefs under the empire. Greec-Roman art is most original in its decoration, which assumes an exuberance and fantastic variety foreign to the pure Greek tradition of moderation and sobriety, while retaining much of the Greek elegance See Pompsian. (a) A member of the ancient Greek race, one of the chief factors in the history of civilization, inhabiting the territory of Greece, comprising part of the southeastern peninsula of Europe and the adjoining islands, and also extensive regions on the coasts of Asia Minor, Sicily, southern Italy (Magna Græcia), etc. Asa result of the conquests of Alexander the Great, many parts of western Asia, Egypt, etc., became partly Hellenlæd. The true Greeks, or Hellenes, consisted only of the Dorians, Epides many peoples of different stock, as the Macedonians, Epirotes, Acarnanians, etc. (b) A member of the modern Greek race, which has descended, with more or less foreign admixture, from the ancient race; especially, a in its widest sense, includes many peoples of different stock, as the Macedonians, Epirotes, Acarnanians, etc. (b) A member of the modern Greek race, which has descended, with more or less foreign admixture, from the ancient race; especially, a subject of the modern kingdom of Greece.—2. The language spoken by the inhabitants of Greece or by persons of the Greek race. Greek is a branch of the great Indo-European family of languages, being thus ultimately akin to English. Ancient Greek comprised a large number of dialects spoken in Greece proper, and on the coasts of Asia Minor and the adjacent islands, as well as in the numerous colonies of Greeks along the coast of the Mediterranean and Black seas, from Syria and Egypt to Italy, Sicily, and Spain. Of these dialects, four are usually distinguished as having received literary cultivation, namely, Ionic, Doric, Molic, and Attic. The Old Ionic appears in the Homeric poems (hence also called Epic): the New Ionic in the histories of Herodotus. The Doric includes a number of different dialects usually characterized as "rough" or "broad," as contrasted with Attic or Ionic, namely, Dorian, Laconian, Corinthian, Megarian, Delphian, Rhodian, Cretan, Cyrenian, Syracusan, etc., literary remains being scant (Theocritus, etc.). Molic includes Lesbian, Beotian, Thessalian, etc., also with scant literary remains (Pindar, Alcsus, Sappho, etc.). Doric and Æolic are made to include many other dialects loosely classified under these names. The Attic, the dialect of Athens, became the standard literary tongue of Greece, and contains nearly the whole of Greek literature. In its later form, as the common dialect, it became the general language of the Greek peoples. As the common speech at Alexandria and in Palestine, it was the language in which the Old Testament became current (the Septuagint), and in which the New Testament was written. It continued, with slight changes, to be the literary language of the Greek world until the fall of the Eastern Empire; and the popular spoken form needed by modern science are generally derived. Together with Latin, the Greek language has long formed the accepted basis of a scholarly education. Modern interest in its study dates from the fifteenth century, when the Turkish inroads upon the Bysantine empire, and particularly the conquest of Constantinople in 1458, caused the permanent settlement of many Greek scholars in Italy, and hence influenced profoundly the development of the Renaissance. (See Renaissance.) Greek is divided chronologically, in the etymologies of this work, into Greek proper (Gr.), ancient or classical Greek to about the year A. D. 200; late Greek (LGr.), from that time till about A. D. 500; and modern or new Greek (MGr.), till about A. D. 1500; and modern or new Greek (MGr.), till about A. D. 1500; and modern or new Greek (MGr.), till about A. D. 1500; and modern or new Greek (MGr.), since that date; these periods corresponding to similar periods of Latin. (See Latin.) Middle and New Greek are also called Romaic. Greek is usually printed in type imitated from the forms of letters used in the later manuscripts. The most ancient manuscripts and the inscriptions exhibit only the capital or words. The small letters are comparatively modern. Since it is the only language printed in this dictionary in other than Roman letters, the Greek alphabet, with the Roman equivalents, is here given:

(b) Greek sculpture developed comparatively late, but by the beginning of the fifth century B. C. it had gained a position on a par with that of architecture. The earliest of reek sculpture was in wood (see sconons); all examples of it have perished. Later, this was imitated in bronse, the first use of the latter material being ascribed to the arists of Chlos and Samos. In the latter half of the sixth century were produced the beautiful painted archaic statues which, until they were unearthed during the last decade, remained buried on the Athenian Acropolis from the time of their entombment during the limprovements which followed the Persian wars. (See archaic.) The Æginetan marbies (see Æginetan) of the entury mark the last period of the fifth century was the period of Phidias (see thos.) and the artists grouped about his name, as Myron and Polycletus. The following century majesty and the lofty ideal gave place to a more individual and intimate, and the artists grouped with supplied by painted was for the study of Greek architecture for the Greeks, but was practically never employed by them where it could be seen. The most typical production of Greek architecture is the content of the study of Greek architecture found its highest expression in stone, particularly in ma

appeared, and in vase-paintings. Baked bricks are rare or not found in truly Greek work, unless possibly in pre-historic times. Much use, however, was made of unburned brick, even at a comparatively late date, and considerable remains of such work have been found at Olympia, at Eleu-sia, and elsewhere. The marble buildings of the period

of perfection, simple and imposing in their general composition, were enriched with statuary and sculptured ornament and brilliantly colored (see polychromy in architecture, under polychromy) to bring out all their details with full effect in the clear air of the Mediterranean. Until Macedonian preponderance had vitiated the ideals of independent Greece, all this magnificence of art was reserved for the glory of the goods and the public buildings of the state. Luxury in private life was not approved, private houses being small and plain. See macenry (Greek)—Greek Church, the church of the countries formerly comprised in the Greek, Greco-Roman, or Eastern (Roman) Empire, and of countries evangelized from it, as Russia: the church, or group of local and national Oriental churches, in communion or doctrinal agreement with the Greek partarchal see of Constantinople. It is also called the Kastern Church, in distinction from the Western, the Letis, or Roman Catholic Church. The tull official title of the Greek Church is the Holy Orthodox Catholic Apostic Oriental Church. (See Catholic, a., 3 (c)). The epithet Orthodox is that most frequently used for the Greek or Eastern Church. The estrangement between the Greek and Latin churches culminating finally in the Great Schimm, stands historically in close connection with the division of the Roman Empire into an Eastern and a Western Empire, with the growing power of the see of the new Roman capital, Constantinople on New Rome, the increasing rivalry between the see of Old Rome and that of New Rome, the insertion by the Latin Church of the Piloque (see Pilioque) in the Nicene Greed, the question of the ecclesiastical allegiance of the Bulgarians, and of the Roman patriarchate, remained with the Eastern Church. II. n. 1. The color of ordinary foliage; the color seen in the solar spectrum between wavelengths 0.511 and 0.543 micron. According to the theory generally accepted by physicists, the sensation of

pure green is a simple one. This sensation cannot be excited alone in a normal eye; but the spectrum at wavelength 0.524 micron, if the light be very much reduced, probably excites the sensation with some approach to purity. It is a common error to suppose that green is a mixture of blue and yellow. This notion arises from the observation that a mixture of blue and yellow pigments generally gives a green. The reason of this is that the color of pigments not having a true metallic appearance is that of the light which they transmit; the blue pigment outs off the yellow rays and the yellow pigment the blue rays, but certain green rays are transmitted by both. But blue and yellow lights thrown together upon the retina excite a sensation nearly that of white, which may incline alightly to green or to pink according to the tinge of the colors mixed. Green under a high illumination appears more yellowish (the sensation being affected by the color of brightness), and darkened appears more bluish; this is especially true of emerald and yellowish greens (above all, of olive greens), and hardly holds for turquoisegreen. The terms and phrases below are the common names for hues of green, some of them being also names of pigments.

their parts in the play.

The Friday came; and for the first time in my life I found myself in the greenroom of a theatre—it was literally a green room, into which light was admitted by a thing like a cucumber-frame at one end of it. It was matted, and round the walls ran a bench covered with faded green stuff, whereupon the dramatis personse deposited themselves until called to go on the stage; a looking-glass under the sky-light, and a large bottle of water and a tumbler on the chimney-piece, completed the furniture of this classic apartment.

greensand (gren'sand), n. A sandstone containing grains of glauconite, which impart to it a greenish hue. There are two sets of strata in England to which this name is applied; one is above the galt, the other below it. The greensand is also a formation of importance in the United States. It is extensively mined in New Jersey for fertilizing purposes, and commonly called marl. The glauconite is a silicate of iron and potash, and this mineral forms sometimes as much as 90 per cent, of the greensand, the rest being ordinary sand.

sand.

The chambers of the Foraminifera become filled by a green silicate of iron and alumina, which penetrates into even their finest tubuli, and takes exquisite and almost indestructible casts of their interior. The calcareous matter is then dissolved away, and the casts are left, constituting a fine dark sand, which, when crushed, leaves a greenish a fine dark sand, which, when crushed, really mark, and is known as green-sand.

greenstone (grēn'stōn), n. [First used in G. (grünstein): so called from a tinge of green in the color.] 1. Any one of various rocks, of eruptive origin, in general older than the Tertiary, crystalline-granular in texture, and of a dark-greenish color. The essential ingredients of the rocks formerly classed under the name of greenstone are triclinic feldspar and hornblende, with which are associated various other minerals in greater or less quantity, and especially chlorite, mics, magnetite, and apatite. The name is abandoned by some lithologists, but retained by

many geologists as a convenient designation for those older cruptive rocks which have undergone so much alteration that their original character is in a measure lost, and cannot be made out except with the aid of the microscope, and not always with that help. The most important of these changes seems to be that the original angite has been converted into hornblende, while a still more advanced stage of alteration is indicated by the presence of chlorite, mica, and other minerals, the predominating color of which is greenish, and to this peculiarity the rock owes its name. While there can be utilitied doubt that many of the so-called greenstones, or melaphyres and diorites, as rocks of this class have of later years been often designated, are altered basalts, there is far from being a general agreement among lithologists as to the proper limitation of these names. See basalt, diorite, melaphyre, trap.

Gregarina (greg-a-rī'nā), n. [NL., < L. gregarius, gregarious, + -ina.] 1. The typical genus of the Gregarindæ. G. gigantea, the gregarine of the lobster, attains a length of two thirds of an inch.—2. [l. c.; pl. gregarinæ (-nē).] One of the Gregarindæ; a gregarine.

(-ne).] One of the Gregarinaa; a gregarine.

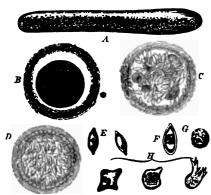

The gregarinae have a peculiar mode of multiplication, sometimes preceded by a process which resembles conjugation. A single gregarina (or two which have become applied together) surrounds itself with a structureless cyst. The nucleus disappears, and the protoplasm breaks up... into small bodies, each of which acquires a spin-die-shaped case, and is known as a pseudo-navicella. On the bursting of the cyst these bodies are set free, and ... the contained protoplasm escapes as a small active body like a Protamesba.

tractile vacuole. Changes of form are effected by a power of contractility, and the animals are nourished by absorption of nutriment already prepared in the bodies of the animals in which they are parasitic, as insects, worms, and crustaceans. Reproduction is effected, with or without conjugation, by a process of sporation in which an encysted individual becomes filled with a mass of peculiar bodies known as peculo-navicelles, which discharge amebiform contents sometimes called flagellules or drepanicia. All Gregarinide are parasites, but none, as far as known, infest vertebrates. The family name applies—(1) to all gregarines; (2) especially to the septate gregarines, for which Dicystides is also used. Numerous genera have been proposed, but few can be considered established, as Monocystis of the single-celled division, with Gregarina proper and Hoptorhyachus of the septate division. These two divisions correspond, respectively, to Monocystidea or Haplocyta, and to Dicystidea or Septata, when the family is ranked as a class or subclass named Gregarinidae of Gregarinides.

Gregarinidea (greg'a-ri-nid'ē-ā), n. pl. [NL., Gregarina + -idea.] The Gregarinidæ, in the widest sense, regarded as a subclass of Sporo-

talline-granular texture, and chiefly made up of quartz and mica. Its relations to granite are such as to lead lithologists to believe that it is an altered form of that rock, in which the feldspar has been replaced by quartz, at the same time that various accessory minerals, very characteristic of the greisen, have made their appearance. These accessory minerals are topas, fluor-spar, rutile, tourmaline, and others, and especially cassiterite (oxid of tin), which is almost invariably found associated with this rock. Greisen is a very characteristic rock of the Ergebirge and of its tin-mines. See granute.

grosbeak (grōs'bēk), n. [< gross, large, thick, + beak¹, after F. grosbec, grosbeak.] A bird having a notably large, heavy, or turgid bill: usually a general and indefinite name of birds of

the family Fringillida: in the plural loosely synonymous with the nominal subfamily Cocco-thraustina. Among familiar examples may be noted the hawfinch or hawthorn-grosbeak, Coccothraustes vulgaria, and the greenfinch or green grosbeak, Liguriaus chloria, both of Europe. (See cut under hawfach.) The pine-grosbeak, Pinicola enucleutor, is common to both Europe and America. Peculiar to the latter country are the evening grosbeak, Hesperophona vespertina; the blue grosbeak, Guiraca cerulea; the rose-breasted grosbeak, Zamelodia (or Habia) ludoviciuna; the black-headed grosbeak, or cardinal-bird, Cardinulis virginianus. (See out under Cardinalis.) A few large-billed conirostral birds not of the family Fringillida receive the same name, as the grenadler, an African weaver-bird, and some of the thick-billed American tanagers, indicating a former very extensive use of grosbeak as an English book-name of birds of the Linnean genus Loxia in a wide sense. Less frequently written grossbeak.

ground-rent (ground'rent), n. The rent at
which land is let for building purposes. It is a
common practice of owners of land in large cities who
wish a permanent fixed income without care of buildings
and frequent changes of tenants to let vacant land on long
leases, with covenants for renewal, and with stipulations
that the leasee shall build, and may remove the building
before the end of the term, or shall allow the leasor to take
it at an appraisal.

In country houses, at a distance from any great town,
where there is plenty of ground to choose upon, the groundrent is scarce any thing.

ground-robin (ground'rob'in), n. Same as che-

ground-room; (ground'röm), n. A room on the ground floor. Nares.

The innkesper introduced him into a ground room, expressing a great deale of joy in so luckily meeting with his old friend. Great Britans Hongombs (1712), MS.

ground-rope (ground'rop), n. The rope along the bottom of a trawl-net.
ground-scraper (ground'skra'per), n. The South African ground-thrush, Geocichia litsisirupa, formerly called Turdus strepitans. Sir Andrew Smith.

ground-scratcher (ground 'skrach 'er), n. In Blyth's system (1849), specifically, one of the Rasores or gallinaceous birds.

round-oakt (ground'ōk), n. A sapling of oak.

Then Robin Hood stept to a thicket of trees, And chose him a staff of ground oak.

Robin Hood and Little John (Child's Ballads, V. 218).

ground-parrakeet (ground'par-a-kôt'), n. A parrakeet of the genus Pezoporus or of the genus Geopsitacus.

ground-peas (ground'pō), n. The peanut.

Sportsman's Gazetteer.

ground-pearl (ground'perl), n. A scale-insect of the Bahamas, Margarodes formicarum, living under ground and acquiring a calcareous shell-like covering, somewhat like that of a mollusk. It is used for making necklaces by the natives, whence the name.

ground-pigeon (ground'pig), n. 1. Same as ground-dove (b).

ground-pigeon (ground'pin), n. 1. A tufted, spreading herbaceous plant of the genus Ajuga (A. Chamagniya), natural order Labatan forman. The Senecio vulgarie, an annual European weed belonging to the Compositæ, adventitious in the northeastern United States. It is emollient and slightly acrid, and is used as a domestic remedy for various allments. The name is sometimes applied generally to species of the genus Senecio.

groundsel², n. See groundsill.

groundsopt, groundsopet, n. [Early mod. E. groundsoppe, < ME. groundsope, grundsope, < AS. grundsopa (= D. grondsop, grondsap = MHG. gruntsophe, G. grundsuppe), dregs, lees, grounds, < grund, ground, + *sopa, *soppa, sop: see ground and sop, n.] Dregs; lees; grounds.
Palsgrave.

ground-sparrow (ground'spar'ō), n. A ground-bird; one of several small grayish and spotted

bird; one of several small grayish and spotted or streaked sparrows which nest on and usually keep near the ground, as the savanna-sparrow and the grass-finch, bay-winged bunting, or vesper-bird. [New Eng.] ground-squirrel (ground'skwur'el), n. 1. A terrestrial squirrel-like rodent, as one of the genera Spermophilus and Tamias: especially applied in the United States to species of the latter genus, as Tamias striatus, the hackee or chipmunk. In the United States, where there are more chipmunk. In the United States, where there are more kinds of ground-squirrel than in any other part of the world, those of the genus Spermophilus are mostly called gophers, by confusion with the entirely different animals of the genera Geomys and Thomomys. See chipmunk, gopher, and spermophile.

2. An African squirrel of the genus Xerus.

ground-starling (ground'stär'ling), n. An American meadow-lark; a bird of the family Icteridæ and subfamily Sturnellinæ, as Sturnella magna or Trupialis militaris.

ground-strake (ground'strak), u. Same as gar-board-strake.

groundswell, n. An obsolete variant of ground-

ground-swell (ground'swel), s. A broad, deep swell or rolling of the sea, occasioned by a distant storm or heavy gale, and sometimes also by distant seismic disturbances: sometimes used figuratively of a rolling surface of country, and also of a rising wave of sound or of emotion.

Groundsvells are rapidly transmitted through the water, sometimes to great distances, and even in direct opposition to the wind, until they break against a shore, or gradually subside in consequence of the friction of the water.

Brande and Cox.

The vessel leaned over from the damp night-breeze, and rolled with the heavy ground-neell.

R. H. Dana, Jr., Before the Mast, p. 4.

ground-table (ground'tā'bl), n. In arch., same

ground tackle (ground tak'l), n. Naut., a general term for the anchors, cables, warps, springs, etc., used for securing a vessel at

anchor.

ground-thrush (ground'thrush), n. 1. A bird of the genus Cinclosoma.—2. A thrush of the genus Geocichia. No American thrushes have been placed in this genus, except by Seebohm, who refers to it the varied thrush or Oregon robin, as G. nævia; the Alaskan ground-thrush, a bird usually called Turdus nævius or Hesperocichia nævia; and a Mexican form, the Turdus pinicola of Sciater. A few of the ground-thrushes present the anomaly of 14 tail-feathers, as G. varia, forming with most authors the type of another genus, Oreocincia. Other differences among the species have also been recognized as generic, whence the names Zoöthera, Turdulus, Cichlopasser, Chamætulus, and Peophocichia, the type-species of which genera are respectively G. monticola, G. vardi, G. terrestris, G. componova, and G. simensia. The G. or Oreocincia varia is White's ground-thrush of Siberia, China, Japan, and southward to the Philippines;

it has also been found as a straggler in Europe. Nearly related to this are G. hanci and G. horsfieldi, respectively the Formosan and the Javan ground-thrush. G. dauma, the Dauma thrush of Latham, is found in the Himalayas and southward in India; G. lundata is South Australian; G. heinei is North Australian; G. macrorhyncha is Tasmanian; G. nidgiviensis is confined to the mountains of southwestern India; G. papuensis inhabits New Guines; G. imbricata is Ceylonese; G. mollicsima and G. disoni are Himalayan and Indian. G. monticola, G. marginata, and G. andromedæ form a group of saw-billed ground-thrushes (Zoöthera) of the Himalayas, India, Java, etc. Among African forms are G. princei of Guinea, G. compsonota of the Gaboon (type of Chamatylas), G. bivittata of the Gold Coast, G. gurnsyi and G. piagii of the Uganda country. The Cameroons, and G. piagii of the Uganda country. The Abyssinian ground-thrush is G. sinensis, which with the South African G. litistiriupa (tormerly called Turdus strepitans) represents a division of the genus called Psophocichla. The Macassar ground-thrush is G. erythronota of Celebes. G. interpres, figured by Temminck in 1823 as Turdus interpres, is supposed to be the type of Geocichla; it is found in Java, Sumatra, and Lombok. The spotted ground-thrush is G. epilopiera of Ceylon; G. peroni inhabitis Timor. G. cyanotus is the white-throated ground-thrush of central and southern India. G. citrina is a bird long known as the orange-headed thrush (Latham), inhabiting the Himalayas from Nepal to Assam, and migrating southward in India, and even to Ceylon. G. relecula is confined to Java; G. andamensis inhabite the Andaman islands; G. alboyularis, the Nicobars; G. timotata is the Malay ground-thrush; G. wardi is the pied ground-thrush of India (type of Turduius). G. shirica is a species known to the early writers as the white-browed thrush (Turdus sibiricus or T. auroreus), of wide distribution in Asia and neighboring islands. An isolated form is Kittlitz's ground-thrush, G. terrestri, of the

groundwallt, n. [< ME. groundwalle, groundewalle, grundwalle, grundwalle, Grundwalle, grundwalle, grundwalle, grundwalle Dan. grundwold), a foundation, < grund, ground, + weall, wall.] A wall as foundation; a foundation.

instruments of the same class: as, the wood-wind group.—5. In math., a set of substitutions (or other operations) such that every product of operations of the set itself belongs to the set; a system of conjugate substitutions; a set of permutations resulting from performing all the substitutions of a conjugate system upon a series of elements; a set of functions produced by the constitutions of a conjugate system upon a by the n operations of a group of operations from n independent functions, called the fundamental system of the group. The order or de-gree of a group is the number of substitutions it contains; its index is this number divided into the whole number of permutations of the elements of the substitutions.— Abelian group, in math., an orthogonal group whose substitutions transform the function

$$\frac{n}{2} (x_{\lambda} \eta_{\lambda} - \xi_{\lambda} y_{\lambda})$$

into itself, except for a constant factor.—Alternating group, a group of alternating numbers.—Antipotential group, in math., a group each of whose substitutions is formed from a given group of substitutions, s_1, s_2, s_3, s_4 , etc., as follows: Beginning with any one of these substitutions, t, we find a cycle of substitutions s_a, s_b, s_{γ} etc., such that

$$t = s_{\alpha} s_{\beta}^{-1} = s_{\beta} s_{\gamma}^{-1} =$$
, etc.,

and then each of the cyclic substitutions $(\alpha, \beta, \gamma, \text{ etc.})$ is a substitution of the antipotential group.—Associate groups, in math., groups of associate substitutions.—Cambrian group. See Cambrian.—Chemung group, the name given by the geologists of the New York survey to certain rocks of Devonian age largely developed in Chemung county and other southern counties of New York, and further south through the Appalachian region. They are chiefly sandstones and coarse shales, and the series has a thickness of from 1,000 to 1,500 feet in New York, and a still greater in Pennsylvania.—Cincinnati group. See Hudson River group.—Clinton group, the name given by the New York geologists to that part of the Upper Silurian series which lies between the Medina sandstone and the Niagara group. The rock is chiefly an argiliaceous sandstone, much of which is quite hard, and divided into layers having a peculiar wavyor knobby surface. The name is given with reference to the town of Clinton in Oneida county, New York. This group is of special interest from the occurrence in it of important deposits of iron ore. See Clinton ore, under ors.—Commutative groups, in math., two groups such that the product of two substitutions belonging to one and the other is independent of the order of the factors.—Competite group, in math., one which contains a self-conjugate subgroup other than the group itself and unity.—Congruence group of the other of the factors.—Competite group, in math., one which contains a self-conjugate subgroup other than the group itself and unity.—Congruence group of the other single operation. Played and unity.—Congruence group of the other of the factors.—Competite group, in math., one which consist of all substitutions (ac + β)/(ye + β), where $a\beta - \beta \gamma = 1$, and where $a\beta$, γ , δ are whole numbers, satisfying congruences to the modulus q.—Continuous group, in math., a group of cremona substitutions, among which infinitely mail transformations occur.—Cremona group, in math., a group of rotations a group

$$z^1 = \frac{az+b}{cz+d},$$

by which a certain circle in the plane of imaginary quantity is transformed into itself.— Group of an equation, in math, see equation.— Group of a dimensions, in math, a group whose elements have each k indices, or are arranged in a matrix of k dimensions.— Hamilton group, in gool, a division of the Devonian series, as established by the New York geological survey. Its geological position is between the Marcellus and the Genesse shale, and it extends south and west from New York over an extensive area. Shales and flagstones are its characteristic petrographic feature, and the quartes in this formation are of value and importance.— Harlech group, in Eng. geol., the lowest division of the Primordial or Cambro-Silurian series,

made up of sandstones, slates, flagging-stones, etc., developed to great thickness, and containing Paradoxides, Linguislia, and other forms characteristic of the primordial fauna of Barrande.—Hudson River group, in geol., a division of the Lower Silurian series, as instituted by the New York geological survey. The rocks of this series are shales in New York, but become calcarcous to the west. It is an important group, rich in fossil remains, and especially well developed in the vicinity of Cincinnati. Some parts of the Hudson River shales contain a large amount of bituminous or combustible matter. The term Cincinnati group is used by some geologists as the equivalent of Hudson River group.—Hyperfuchsian group, in math., a group of transformations in four-dimensional space by each of which a fundamental sphere is transformed into itself.—Icosahedral group, in math., the group of rotations by which an icosahedron is brought to coincide with itself; the group of 60 even permutations of 5 things.—Infinite group, in math., a group consisting of an infinity of different substitutions.—Isomorphous groups, in math.:

(a) As usually understood, groups such that the operations of the other, so that a product of operations in the one corresponds to the product of the corresponding operations in the other. (b) In Capelli's extended sense, groups which can be separated each into the same number of subgroups, so that a substitution of a subgroup in the one can be so coordinated to one of the other that products shall correspond to products.—Laramine group, in geol., a division of the Cretaceous, as developed in the Rocky Mountain region, of importance on account of its thickness and because it contains a considerable quantity of lignite: hence also called the Lignitic group. "It is allied to the Cretaceous in its dinosaurs, and to the Tertiary in its fossil plants, and is thus intermediate in its life between the Cretaceous and the Tertiary." (Dana.)—Linear group, in math., a group of permutations given by advancing the ele

$$t = s_{\alpha}^{-1} s_{\beta} = s_{\beta}^{-1} s_{\gamma} =$$
, etc.

 $t=s_{\alpha}^{-1}s_{\beta}=s_{\beta}^{-1}s_{\gamma}=$, etc.

Primitive group of the nth class, in math., one in which every substitution except 1 changes n letters at least.—
Quadratic group, in math., a group consisting of unity and three rotations through 180° about three several orthogonal axes.—Quaternion group, in math., a set of quaternions whose products and powers are members of the set.—Simple group, in math., one containing no self-conjugate subgroup.—Tetrahedral group, in math., the group of 12 rotations by which a tetrahedron is brought back into coincidence with its initial position; the group of even permutations of 4 things.—Transitive group, in math., a group by some substitution of which any element can be brought to any place. A group is called doubly, triply, or n times transitive if any set of 2, 3, n elements can be brought to any places.—Wenlock group, in geol., the name of a division of the Upper Silurian as developed in Wales and the adjoining counties of England. It is made up of limestones and shales, is very rich in fossil remains, especially brachlopods, gastropods, crinoids, corals, and trilobites. In geological age it is the representative of the Niagara limestone and shale of American geologists.

group¹ (gröp), v. [= D. groeperen = G. gruppen,
gruppiren = Dan. gruppere = Sw. gruppera, < F.
grouper, group; from the noun.] I. trans. To
form into a group or into groups; arrange in a
group or in groups; separate into groups: commonly with reference to the special mutual relation of the things grouped, to classification,
or to some special design or purpose, as artistic
effect.

The difficulty lies in drawing and disposing, or, as the ainters term it, in grouping such a multitude of different painters objects.

Here the supreme art of the designer consists in disposing his ground and objects into an entire landskip and grouping them . . . in so easy a manner that the careless observer . . discovers no art in the combination.

bird with feathered feet. It is a local modification or insular race of the common ptarmigan of Europe. Hence—2. Some bird like the above; any bird of the family *Tetraonida* and above; any bird of the family Tetraonide and subfamily Tetraonine. These birds all have the feet and nasal fosses more or less completely feathered, being thus distinguished from pheasants, partridges, qualis, etc. There are numerous species, of several genera, all confined to the northern hemisphere. The largest is the European wood grouse or cock-of-the-woods, Tetrao urogalius. (See cupercuillie.) The next in size is the American sage-grouse or cock-of-the-plains, Centrocercus urophasianus. The black grouse is Lyrurus tetriz of Europe. The ruffed grouse are several species of Bonusu, as the European hazel grouse, B. betulina, and the American, B. umbellus. Notable American forms are the sharp-tailed grouse, Pediacetes phasianellus, and the pinnated grouse, Cupidonia acupido; both are known as prairie-hens. The snow-grouse are sundry species of ptarmigan inhabiting boreal and alpine regions, and mostly turning pure white in winter; such are the willow-ptarmigan, Lagopus albus, the rock-ptarmigan, L. rupestris, and the Rocky Mountain ptarmigan, L. leucurus.

3. In the widest sense, as a collective plural, the grouse family, *Tetraonidæ*. In this sense the word includes various partridges and rethe word includes various partriages and re-lated birds.—Canada grouse, Canace or Dendraga-pus canadensis. Also called spruce-grouse, black grouse, spotted grouse, wood-partridge, swamp-par-tridge, ceder-partridge, spruce-partridge, healt-hen, and formerly black and spotted heath-cock (Edwards, 1758). See cut under Canace.—Dusky grouse, the most com-mon name of Canace or Dendragapus obscurus, a large dark slate-colored arboreal grouse of mountainous parts of western North America. Also called blue grouse, gragrouse, and pine-grouse. It runs into several local varities, one of which is called Richardson's grouse or blace

tailed grous: It is the largest of the American tetraonines excepting the sage-cock, the male attaining a length of 2 feet and an extent of wings of 30 inches. It is chiefly found in the coniferous belt.—Pinnated grouse, the prairie-hen, Cupidonia cupido or Tympanuchus americanus: so called from the winglets on each side of the neck. See prairie-hen, and cut under Cupidonia.—Buffed grouse, Bonasa umbellus. Also called rufed heath-cock (Edwards, 1769), brown, gray, or red rufed grouse, drumning grouse or partridge, tippet-grouse, shoulder-knot grouse, birch-partridge; also simply partridge in the northern and middle portions of its range, and universally pheasant from Pennsylvania southward. See cut under Bonasa.—Bage-grouse, the sage-cock or cock-of-the-plains, Cantrocercus urophasianus: so called because characteristic of the sage-brush regions of western North America. See cut under Centrocercus.—Sharp-tailed grouse, any grouse of the genus Pediacetses.

1. The act of warranting or securing; a warrant or surety. rant or surety.

The counsellor . . . pledged a word, till then un to that lie for which no gauranty but his could even a momentary credence. W. Phillips, Speed 2. Specifically, in law, a separate, independent contract by which the guaranter undertakes, in contract by which the guarantor undertakes, in writing, for a valuable consideration, to be answerable for the payment of some particular debt, or future debts, or the performance of some duty, in case of the failure of another person primarily liable to pay or perform. Colebrooke, On Collateral Securities. One may orally assume the debt of another, making himself a debtor immediately; but if the engagement is a mere guaranty of the obligation of another it must be in writing. [Guarantee is often used for guaranty, but in legal matters it is more correct to use guaranty for the name of the promise or contract of guaranty, guaranter for the maker of the guaranty, and guarantee for the person for whom the guaranty is made, and also for the act of performing the guaranty.

The nature and soul of things takes on itself the guaranty of the fulfilment of every contract, so that honest service cannot come to loss. Emerson, Compensation.

Guaranties often extend to all the provisions of a treaty, and thus approach to the class of defensive alliances.

4. pl. In cricket, the pads or protectors worn on the legs to prevent injury from swiftly thrown balls.—5. Any part, appliance, or attachment designed or serving to protect or secure against harmful contact, injury, loss, or detriment of designed or serving to protect or secure against harmful contact, injury, loss, or detriment of any kind. (a) That part of the hilt of a sword which protects the hand. Swords of antiquity and of the middle ages usually had the cross-guard. In the streenth century, when the use of steel gloves was abandoned and the sword became the chief weapon of persons not armed for war, the guard was made more elaborate by the addition of the pas d'ane. Toward the end of that century the knuckle-bow was added, some swords combining these two additions with two straight quillons of which the cross-guard is formed. (See cut under kilt.) Another guard of this epoch was the shell-guard. The basket-hilt came into use toward the close of the sixteenth century and lasted through the seventeenth. (See cut under claymors.) In the second half of the seventeenth century the guard became more simple, and consisted chiefly of a knuckle-bow, the shell of the guard when still used being reduced to a very small saucer-shaped plate surrounding the blade. The knuckle-bow guard continued in use throughout the eighteenth century in swords worm with civil costume, as well as in most of those used in war, and is still the guard of the modern sword and saber, some cavalry sabers and the like having this knuckle-guard so expanded laterally as to approach the form of the basket-hilt. (b) In a firearm, the metal bow or other device which protects the trigger. Also called trigger-guard. (c) An ornamental lace, hen, or border; hence, in the plural, such ornaments in general.

welf, the young of dogs, and of wild animals,

= AS. hwelp, E. whelp: see whelp.] A member of the papal and popular party of Italy in the middle ages, opposed to the Ghibellines, the imperial and aristocratic party. The Welfs (Guelfs) were a powerful family of Germany, so called from Welf I., in the time of Charlemagne. His descendants, several of whom bore the same name, held great possessions in Italy, through intermarriage, were at different times duke so Bavaria, Saxony, and Carinthia, and founded the princely house of Brunswick and Hanover, to which the present royal family of England belongs. The names Welf and Waiblinges (Guelf and Ghibeilline) are alleged to have been first used as war-cries at the battle of Weinsberg in 1140, fought and lost by Welf VI. against the Hohenstaufen emperor Conrad III. The contest soon ceased in Germany, but was taken up on other grounds in Italy, over which the emperors claimed supreme power; and the names continued to designate bitterly antagonistic parties there till near the end of the fifteenth century.

[This use is common in English literature from the first appearance of the word; but it is now regarded as colloquial, and, from its frequency in the United States, it is generally supposed by Englishmen to be an "Americanism."

By an easy extension guess is used for think, believe, or suppose, even where the meaning is not at all conjectural, but positive, and it is then logically superfluous, serving merely to make the assertion less abrupt: as, I guess I will go now (that is, I am going now); I guess I know what I'm about (that is, I know what I am doing). In most instances this use probably arises from a desire to avoid positive assertion, or from some feeling of hesitation or uncertainty.]=Syn. 1. Imagine, Presume, etc. See conjecture.

=Syn. 1 and 2. Guide, Direct, Sway; manage. control, pflot, steer. Guide implies that the person guiding accompanies or precedes, while direct need not mean more than that he gives instructions, which may be from a distance. The figurative uses of these words are not far from the same meanings. Direct may imply that we must reflect and exercise judgment, guide that we trustingly follow where we are led; but direct also means to exercise absolute authority: as, he directed all the movements of the army by telegraph from the seat of government. Sway in this connection is used of some influence, often bad and always strong, which turns us aside from what otherwise might have been our course, and in this sense is nearly equal to bias. See comparison under authority.) We are guided or directed by principle or reason, or by a real friend, and swayed by our passions or feelings, or by unwise or unworthy associates.

E. dial. willock, the guillemot), + OF. moette, F. mouette, a sea-mew, of Teut. origin (see mew?). The F. word is thus (appar.) a cumulative compound, consisting of a Celtic word, gull, explained by its Teut. synonym, mew.] A bird of the genus Uria of Brisson, or of either of the genera Uria and Lomvia of late authors; a murre. There are several species, of the subfamily Uriana and family Alcida. The common or foolish guillemot or willock, Lonvia troile, is a bird about 18 inches long, webfooted, 3-toed, blackish above and white below, with short wings and tall, closely resembling the razor billed auk, Alca torda, except in the form of the bill, which is comparatively long, slender, and acute. It inhabits rocky coasts of the North Atlantic, and congregates in vast numbers to breed, laying a single large pyriform egg on the edges of rocks overhanging the sea. A variety of this species with a white ring round the eye, and a white line behind it, is known as the ringed or speciacled guillemot, and sometimes described as a different species, L. rhingia. Both have many local names, as willy, spratter, quet, scut, shuttock, skiddaw, kiddaw, tarrock, tinker, lungic or lungie, murre, marrot or morrot, lamy or lary, xrany, etc., some of these being shared by the razor-billed auk. (See cut under murre.) The thick-billed or Brünnich's guillemot is Lomina between the color of the seeding shared by the razor-billed auk. (See cut under murre.) The thick-billed or Brünnich's guillemot is Lomina between the color bill. Similar guillemots inhabiting the North Pacific are known as ares or arries. The birds of the restricted genus Uria are smaller and otherwise distinct;

guillotine (gil'ō-tēn), n. [< F. guillotine: see def.] 1. A machine used in France for beheading condemned persons by the action of a heavily weighted, oblique-edged knife falling between two grooved posts upon the neck of the victim, whose head protrudes through a circular hole in a divided plank. Similar devices had been used in the middle ages. (See maiden.) The form adopted by the French government in March, 1792, was contrived, with the approval of the Assembly, by a Dr. Louis, from whom it was at first called louisett; but it afterward was named from Dr. J. I. Guillotin, who had proposed in the National Assembly in 1789 the substitution of some more humane method for the slow and cruel modes of execution then in use, but without indicating any particular machine.

more commonly called cyma reversa or ogee.
See cyma, 1.—2. In entom., a piece which in
some insects forms the lower surface of the
head, behind the mentum, and bounded laterally by the genæ or cheeks. It is conspicuous in

ally by the gense or cheeks. It is conspicuous in the beetles, but in many other insects it appears to be en-tirely absent, or is represented only by the inferior cer-vicial sclerites, little corneous pieces in the membrane of the neck. See cut under mouth-part.

The inferior cervical scierites [of the cockroach] are two narrow transverse plates, one behind the other, in the middle line. They appear to represent the part called gula, which in many insects is a large plate confluent with the epicranium above and supporting the submentum anteriorly.

Huzley, Anat. Invert., p. 347.

3. In ornith., the upper part of the throat of a bird, between the mentum and the jugulum. See cut under bird1.

The front of the neck has been needlessly subdivided, and these subdivisions vary with almost every writer. It suffices to call it throat (gula, or jugulum), remembering that the jugular portion is lowermost... and the gular uppermost, running into chin along the under surface of the head.

—Gulf Stream, an oceanic current which first becomes apparent near the north coast of Cuba, whence it advances castward to the Bahamas, then, turning northward, follows the Atlantic coast with a velocity of from 2 to 5 miles an hour, gradually expanding in breadth and diminishing in depth, but distinctly perceived beyond the eastern edge of Newfoundland as far as about 30 degrees west longitude. Its average breadth from Bermuda to the neighborhood of Nova Scotia is from 300 to 400 miles. Its comparatively high temperature (10 to 20 degrees above that of the aurrounding ocean), rapid motion, and deephluc color make the Gulf Stream a most remarkable phenomenon, and even more interesting than the Kuro Siwo, the corresponding current on the Aziatic coast of the Pacific ocean. The Gulf Stream exerts a most important influence in moderating the climate of France, the British islands, and other parts of western Europe. The distance to which the influence of the Gulf Stream is felt in a northeasterly direction has been the subject of much discussion among thalassographers. It seems pretty clearly established, however, that a considerable proportion of the effect produced on the climate of northern Europe which was formerly ascribed exclusively to the Gulf Stream is in reality due to a current coming from the Antilles (the Antilles Stream), which joins the Gulf Stream to the north of the Bahamas.

There are more than 50 species, inhabiting all parts of the world, belonging chiefly to the leading genus Larus; other genera are Chroleocephalus, Xema, and Rhodostethia. Many of the species are marine or maritime, but gulls are also found over most of the large bodies of fresh water of the globe. They are strong and buoyant filers, spending much of the time on the wing, and are voracious feeders upon fish or any animal substances which they can find in the water. They do not dive. The nest is usually placed on the ground or on rocks, and the eggs are two or

three in number and heavily colored. The voice is rancous or shrill, and the birds are very noisy, especially during the breeding season. The characteristic coloration is white with a pearly, bluish, or fuscous mantle, the primaries usually marked with black; the white in some cases has a beautiful rosy hue. In one group of species the head is enveloped in a dark-colored hood; in another the whole plumage is dark, except the white head; in the ivory guil the entire plumage is white. In the kittiwakes, which constitute the genus Rissa, the hind toe is rudimentary. Among representative species are the ice-guil or burgomaster, Larus glaucus, and the great black-backed gull, L. murisus, these two being the largest species; the herring-gull, L. argentatus; the mew-gull, L. canus; the hooded gulls, Chroccoephalus atricilla; the fork-tailed gull, Krans sabinei; and the wedge-tailed gull, Rhodostethis rosea. In the larger gulls the bill is strong and hooked; in the smaller kinds it is alenderer and straighter, and these grade directly into the terms or sea-swallowase outs under burgomaster and Chroccoephalus.

the shore and a stranded or wrecked vessel. The projectile has at the rear end a shank, to which the line is attached.—Mauser gun, a magazine bolt-gun used in the German army.—Morning gun, a gun fired on a ship of war or at a military post or camp as the first note of the reveille is sounded on the drum, bugle, or trumpet; a reveille gun.—Mountain gun. See mountain-artillery, under artillery.—Multicharge gun, a gun constructed to receive two or more separate charges of powder, which are fired consecutively in rapid succession: as, the Lyman-Haskell multicharge gun. The charge in the breech-chamber is ignited by a friction or other primer; this charge starts the projectile forward, and as its base passes consecutively the openings of the subsidiary chambers or pockets, the charges contained therein are ignited.—Napoleon gun, a bronze 12-pounder used for field-artillery, first adopted in France about 1856, under Napoleon III.—Neck of a gun. See neck.—Paixhans gun, a howitzer for the horizontal firing of heavy shells, introduced by the French general H. J. Paixhans about 1825.—Pailiser gun, a cast-iron gun lined with a tube of colled wroughtiron, invented by Major Pailiser of the British army about 1870. The tube is made in two parts, the breech-end being shrunk on. This system was designed to utilize the old smooth-bore ordnance, by converting it into rified guns.—Parrott gun, a cast-iron rified gun strengthened at the breech by shrinking coils of wrought-iron over it, invented by Captain Parrott of the Cold Spring foundry in New York, and first used in 1861. The calibers are 10, 20, 30, 100, 200, and 300-pounders. The Parrott projectile is of cast-iron, with a brass plate, or sabot, cast into a recessed rabbet to prevent turning. The powder-gas presses against the bottom and under it so as to expand it into the grooves, and thus assures rotary motion to the projectile.—Quaker gun, a log of wood mounted on wheels or some other arrangement, imitating a cannon, designed to deceive the enemy: so called in humorous a

To conceal the absence of carriages, the embrasures were covered with sheds made of bushes. These were the Quaker guns afterwards noticed in Northern papers.

Rampart gun, a large piece of artillery fitted for use on a rampart, and not for field purposes.—Rodman gun, a cast-iron gun with curved outline, being much thicker over the seat of the charge than elsewhere. The peculiarity of this gun is the method of casting, devised by General Rodman of the United States Ordnance Department, and first employed in 1880. Instead of cooling from the exterior, as in the ordinary method, General Rodman cast all large guns with a hollow core, and cooled them from the interior by a stream of cold water or air, at the same time preventing undue radiation from the exterior by surrounding the flask holding the casting with heating-furnaces.—Son of a gun, a rogue; a knave: used humorously.

We tucked him in, and had hardly done
When, beneath the window calling,
We heard the rough voice of a son of a gun
Of a watchman, "One o'clock" bawling.
Earham, Ingoldsby Legends, I. 116.

Spencer gun, an American magazine-rifle containing seven cartridges in a metallic tube, which is inserted in the butt-stock from the rear. The magazine is operated by a lever in the under side of the arm.—Springfield gun, a single-loader with a hinged block, used in the United States army.—To blow great guns (naut.), to blow tempestuously, or with great violence: said of the wind.

Spanking Jack was so comely, so pleasant, so jolly, Though winds blew great guns, still he'd whittle and sing.

C. Dibdin, Sailor's Consolation.

To break a gun, to house guns, etc. See the verba.— Vavasseur gun [named from the inventor of the system], a built-up steel gun with wrought-iron trunnion-band, and having three ribs projecting into the bore to replace the grooves usually employed in riffing.— Vetterli gun [from the inventor, F. Vetterli]. (a) A single-loading small-arm,

(b) A magazine boltgun used in the Italian and Swiss armies. — Whitworth gun, an English rified firearm, whether great or small, having a hexagonal bore, with a twist more rapid than usual: invented by Sir Joseph Whitworth. — Winchester gun, an American magazine-rifie having a horizontal bolt and vertical cartridge-carrier operated by a lever on the under side of the stock. The magazine is below the barrel and in front of the receiver. — Wire gun, a built-up gun made by winding wire about a tube, or by covering the tube with alternate layers wound circumferentially and laid longitudinally. See Woodbridge gun, — Woodbridge gun, a gun consisting of a thin steel tube wound with square wire, the interstices being filled with melted braxing-solder to consolidate it into one mass. — Woolwich gun, a built-up muzzle-loading cannon used in the British service. The tube is made of solid cast-steel drawn out by heating and hammering. After boring, turning, and chambering, the tube is heated to a uniform temperature and plunged into a covered tank of rape oil to harden and temper it. Wrought-iron coils are shrunk on over the tube to complete the structure. The breech-coil is formed of a triple coil, a trunnion-ring, and a double coil welded together. The muzzle-coil is composed of two single coils united by an end-weld. The breech-piece is screwed into the breech-coil so as to abut against the rear end of the tube. The gun is assembled by heating the coils, and these when expanded are slipped over the tube and allowed to contract. The tube is kept cool during this operation by forcing a stream of cold water through the bore. These guns have from 7 to 10 grooves semicircular in cross-section, with curved edges and with a uniformly increasing twist. Also called Fraeer gun. (See also casenate-pun, dynamite-gun, machine-gun, needle-gun, etc.)

on wooden trucks and controlled by tackles; but the requirements of modern gunnery have caused wood to be replaced by brass and iron or steel, and simple tackles by powerful gearing and machinery. In the case of a field-or siege gun-maker (gun'mā"kèr), n. A maker of guns piece the carriage unites, for traveling, with a fore part

fixed on a pair of wheels, called a limber, to which the horses are attached, so as to form a single four-wheeled carriage. In action it is unlimbered or detached from the fore part, and then rests on its wheels and on a strong support called the trail. The protected burbette gun-carriage, also called the Monerief gun-carriage (after its inventor Major Moncrief), is designed to store up the force of recoil on firing, and apply it to the work of raising the gun to fire over a high parapet. When fired the gun descends under cover by its own recoil, assuming at the same time the loading position, in which it is retained by a toothed wheel and ratchet. When reloaded, by releasing the ratchet, it is brought by a counterweight, which the force of the recoil has elevated, back to its original position. The carriage moves laterally on a circular rail laid on the platform, and can easily be turned in any direction. The same inventor has also designed a hydropneumatic carriage, in which the force is stored up in the form of air, highly compressed in a strong iron cylinder. Also called artitlery-carriage, guncotton (gun'kot'n), n. A general name for the nitrates of cellulose, prepared by digesting cotton or other form of cellulose in nitric acid, or preferably in a mixture of nitric and sulphuric

or preferably in a mixture of nitric and sulphuric acids. A series of nitrates may thus be made, differing in composition and properties according to the strength of acids and time of digestion. Weak acids and short digestion will be digestion with a cide and short digestion yield trinitro- and tetranitro-cellulose, which dissolve in a mixture of alcohol and ether. This solution is the collodion of commerce. A highly explosive nitrate, to which the name guncotton more properly belongs, is made by digesting clean cotton in a mixture of 1 part nitric acid, specific gravity 1.5, and 3 parts sulphuric acid, specific gravity 1.85, for 24 hours and thoroughly washing the product. This is a hexanitrate of cellulose, C₁₂H₁₄ (NO₃M₀1₀. It can hardly be distinguished by appearance from raw cotton, and is insoluble in alcohol and ether. When ignited it burns quietly, leaving no residue, but by percussion explodes violently, especially if compressed. Its explosive force is much greater than that of gunpowder. It has been used chiefly for torpedoes and submarine blasting, but is now largely superseded by dynamite. gun-deck (gun'dek), n. See deck, 2. gundelet (gun'de-let), n. A gondola. 2. A small cannon or musket suspended horiz. A small callion or musket suspended normontally in a swinging frame furnished with a fixed arc, properly graduated, and a movable pointer, for ascertaining the angular distance through which the gun oscillates in its recoil. The initial velocity of the projectile is calculated from the value of the arc of recoil. This method is now nearly obsoleta.

gunpowder (gun'pou'der), n. [ME. (AF.)
gounepoudre (1422), (goune, gun, + poudre,
powder.] An explosive mixture of saltpeter, sulphur, and charcoal, reduced to fine powder, and thoroughly incorporated with each other,

then granulated, cleaned or dusted, glazed or polished, and dried. The finished powder is employed for the discharge of projectiles from guna in blasting, and for other purposes. The proportion of the ingredients in the composition of gunpowder varies in different countries, and with the different uses for which it is designed. The powders used for military purposes are distinguished, according to the fineness and evenness of granulation, as (a) irregular, as nusuket, mortar, cannon, and mammoth powders; (b) regular, as cubical, pellet, hexagonal, apherohexagonal, and prismatic (perforated hexagonal prisms) powders. These powders may have the same composition, but differ in size and form of grain, density, and method of manufacture. Musket proader is used for smallarms, mortar-powder for field-guns, cannon powder for light siege-guns, and the larger-grained and special powders for heavy sec-coast guns. Mixtures of a nature similar to gunpowder were known in China and India from remote times, and were especially used for rockets. The invention of gunpowder in Europe has been ascribed to Roger Bacon (about 1214-94) and to a German monk named Schwarz (about 1820), but it was probably introduced into Europe through the medium of the Moors early in the fourteenth century. Its common use in warfare dates from the sixteenth century.

Gymnoblastea (jim'nō-blas-tē'ā), n. pl. [NL., Gr. γυμυός, naked, + βλαστός, germ.] In Allman's system, an order of hydroid polyps, corresponding to the Anthomedusæ of Haeckel's later system, and commonly known as tubula-rian hydroids (in distinction from both cam-panularian and sertularian hydroids, which are panularian and sertularian hydroids, which are calyptoblastic). They are hydromedusans which pass through a hydriform phase, and in which medusiform bodies are developed. Though the ecioderm may secrete a horny tubular protective case or perisare, it forms no cupe for the reception of the crown of tentacles, or cases inclosing groups of medusiform buds. In other words, no hydrothece or gonangia are present, whence the name of the order. The developed meduse have no otocysts or tentaculocysts, but have occill at the bases of the tentacles, usually 4 or 6 in number, corresponding to the number of the radial enteric canals; the sexual glands are placed in the walls of the manubrium. The Gymnoblastea are delicate plant-like marine organisms, usually attached to some foreign body. Their classification is difficult and unsettled. They have been divided into from 2 to 21 families. More or less exact synonyms of the name of the order are Atheotta, Corynida, Gymnotoka, and Tubularina. Also Gymnoblastea.

Gymnodontes (jim-nō-don'tēz), n. pl. [NL., pl. of Gymnodon, q. v.] A group of plectognath fishes, variously rated. (a) In Cuvier's system of classification, the first family of plectognaths, having jaws which are furnished, instead of teeth, with an ivory-like substance internally laminated, resembling the beak of a parrot, and consisting of true teeth united and succeeding each other as fast as they are worn away. (b) In Günther's system, also, a family of plectognath fishes whose jaws are modified into a beak. (c) In Gill's system, a suborder of Plectognathi having no spinous dorsal fin, a body more or less sacciform, scales typically spiniform (archetypically rhomboid) and with root-like insertions, and toothless jaws enveloped in an enamel-like covering. It contains several families, as Diodontidæ, Triodontidæ, and Molidæ. Most of these fishes can blow themselves up into a more or less globular or spherical form by swallowing air, whence they have many popular names, as balloon-fish, bellows-fish, bottle-fish, box-fish, egg-fish, globe-fish, neell-fish or suclitoad, etc. (See globe-fish, and parrot-fish.

contains chiefly marine forms which have no epistome or
valve to close down upon the mouth, no horseshoe-shaped
lophophore, and a complete circlet of tentacles. The
external skeleton is diversiform, chitinous, calcareous, or
gelatinous. The young hatch as ciliated embryos which
swim freely for a time. The order is divided into three
suborders, Cycloromata, Ctenostomata, and Chilostomata,
to which some add a fourth, Paludicellæ, containing freshwater forms which have statoblasts. Most polyzona belong to this order, the families of which are numerous.
They commonly resemble seaweeds, and some are known
as sea-mats. The order is contrasted with Phylactolæmata. Also, incorrectly, Gymnolæma.

Gyps (jips), n. [NL. (J. C. Savigny, 1809), \langle Gr. $\gamma \nu \psi$, a vulture.] The largest genus of 'Gr. $\gamma v \psi$, a vulture.] The largest genus of old-world vultures, containing the several species known as griffins or griffin-vultures, having the nostrils oval and perpendicular, and the rectrices 14. They range over most of Africa, all the countries bordering the Mediterranean, and eastward to countries bordering the Mediterranean, and eastward to gyre, n.] To turn round; wheel; rotate; whirl; move round a fixed point. See gyration. Forthe nostrils oval and perpendicular, and the rectrices 14. They range over most of Africa, all the countries bordering the Mediterranean, and eastward to Persia, India, and the Malay peninsula. The common griffin is *G. fulcus* of Europe and Africa; *G. rucpyelli* and *G. tolbi* are both African; *G. himalayensis* and *G. indicus* are named from the regions they respectively inhabit; and several other species or varieties have been described.

gypset (jips), n. [ME. gipse, < OF. gipse, gypse, < L. gypsum, gypsum; see gypsum.] Same as

Pers. jabsin, lime, Ar. jibs. jibsin, plaster, gypsum.] Native hydrous sulphate of calcium, a mineral usually of a white color, but also gray, yellow, red, and when impure brown or black. It is soft and easily scratched; the crystalline varieties, called selenite, are generally perfectly transparent, and cleave readily, yielding thin fiexible folia. The crystals are frequently twinned, and often have an arrowhead form. The massive varieties are fibrous (satin-spar), foliated, lamellar-stellate, granular to impalpable. The fine-grained pure white or delicately colored variety is called alabaster, and is used for ornamental purposes; the impure earthy kind, when reduced to the anhydrous form by heat, is called plaster of Paris, and is used extensively for making molds, etc. (See plaster.) Gypsum ground to a powder is used as a fertilizer.

gyroscope (ji'rō-skōp), n. [= F. gyroscope, a name given in 1852 by Foucault to his improved form of Bohnenberger's apparatus, ⟨ Gr. γύρος, a circle, + σκοπείν, view.] An in-strument consisting of a fly-wheel, the axis of which can turn freely in any direction, designed to illustrate the dynamics of rotating bodies.

gyrostatic

The instrument commonly called gyroscope is better named gyroscopic top (which see, under gyroscopic). The gyroscope proper of Foucault, shown in the figure, consists of a figure, consists of a figure, consists of a figure, wheel having the small conical bearings of its axis in a well-balanced metallic ring which carries two knife-edges in a line perpendicular to the axis of the fig-wheel; these knife-edges bear upon agates carried in a horizontal plane by an outer vertical ring half suspended from a small copper wire and turning about a vertical axis. The axis of the wheel can thus turn in any direction. By means of an accessory apparatus a velocity of 150 turns a second can be imparted to the fig-wheel. The principal experiments with this apparatus are as follows: First experiment—if, when the fly-wheel is turning rapidly, no considerable force is applied to change the direction of its axis, its direction will remain almost unchanged. For, suppose it were proposed, by an instantaneous impulse, to turn this axis round a fixed axis perpendicular to it; then, at the point where this fixed axis cuts the rim of the fly-wheel, a particle would have to be deflected, and it can be shown by the parallelogram of motions that a velocity must be communicated to it proportional to the velocity it already possessed. Hence, the force required to rotate the axis of a fly-wheel increases with i.s velocity. Accordingly, when the velocity is very high, the friction on the bearings will change the direction of the axis but very little. But all the surrounding objects partake of the rotation of the earth upon its axis. Consequently, the axis of the fly-wheel will have a relative rotation and this may be observed with a microscope. Second experiment.— If the fly-wheel was attached to its axis by a hinge, so that its plane was free to take any inclination to the axis, it is plan that by virtue of centrifugal force it would become perpendicular to the exis in the intervention of the saxis of the first wordstion for the earth, so tha

man gyrl and sulci with those of other mammals encounters difficulties which have thus far been insurmountable except in the cases of the most constant and best marked folds and fissures. (See the cuts.) Additional difficulty is encountered in the fact that different human brains vary in details of the gyrl, and the same brain may differ on its opposite sides. The principal gyrl are noted in the phrases below. The gyrl represent an enormous increase in quantity of the gray cortical matter or cortex of the brain in comparison with the actual superficies of the cerebral hemispheres, some of the folds being separated by fissures an inch or more in depth, and containing three layers of gray matter with three layers of white. The gyrl are to some extent an indication of intellectual power, and are better marked when the mental powers of the individual are at their height than in infancy and senility.

The distinction between gyrus and lobs or lobule, as ap-

plied to lesser driefsons of the surface of the brain, is not always preserved. Gyrus is exactly synonymous with cosputation of the surface of the brain in man and monkeys. In man it is the short graves arching over the upper extremity of the surface of the brain in man and monkeys. In man it is the short graves arching over the upper extremity of the entry in the surface of the brain in man and monkeys. 1. The eighth letter and sixth consonant in the Engsixth consonant in the English alphabet. The written character comes, like A, B, etc. (see A), from the Phenician, through the Greek and Latin; and it had the same place in the Phenician and Latin alphabets as in the English, though made seventh in order in the Greek by the later omission of the F-sign. The comparative scheme of the letter-forms is as follows:

0 8

BH

Pheni-cian. Early Greek and Latin.

Expressan.

Hisroglyphic. Hieratic.

The sound belonging to the character in Phenician was that of a rough guttural spirant, nearly like the ch in German, or in Scotch Lock (marked in his dictionary ch). In the Greek alphabet it had at first the kindred but weaker value and continued with this value is passed or the continued with the same later to be used as a long 4 (down to that time long and short c had been written allke E), the h-sound being indicated by a half H, namely is afterward reduced to cand, which last then retained the h-value, or that of the "rough breathing." So called, now usually printed so the continued of Egyptian. Hieroglyphic. Hieratic.

speaking. In the pronouns he, him, her, when unaccented, as they usually are after another word, the h is almost universally omitted in colloquial speech, an omission long recognized in the common spelling of the related neuter pronoun hit, now always written and pronounced it, and in the colloquial plural hem, now written 'em. The h forms a number of digraphs, or compound characters, some of them of great importance and frequency. The origin of this practice goes back to the earliest Greek period, when the so-called aspirates were real aspirates—that is, mutes with an audible bit of fiatus expelled after them: kh nearly as in backhouse, th as in boat-hook, ph as in haphazard. The sounds were at first so written in Greek, with an h after each mute; later, simple characters were devised to take the place of these combinations. But in Greek words carried into Italy the spelling with h was kept up: thus, chorus, theatrum, philosophus; then, in the change of these aspirates to spirants, unitary values were won by the digraphs; and the use of th, especially with spirant value (thin, that), was widely extended to the Teutonic part of our language. The digraph sh comes by alteration of the k of sk to a spirant, and its fusion with the sibliant, making a more palatal sibliant. The origin of our gh (always either silent or pronounced as f), by graphic change from earlier h, has been stated above. (See also under G.) Finally, rh is found in Greek words, as in AS. Aring (whence it should properly be written hr, as in AS. Aring (whence it should properly be written hr, as in AS. Aring (whence it should properly be written hr, as in AS. 1. In \$Gr\$. myth.: (a) The lord of the lower world, a brother of Zeus, and the husband of Persephone (Proserpine). Hereigned in a splendid palace, and, besides his function of governing the shades of the departed, he was the giver to mortals of all treasures derived from the earth. In art he was represented in a form kindred to that of Zeus and that of Poseidon, and bearing the staff or seepter of authority, usually in company with Persephone. As the god of wealth, he was also called by the Greeks Pluto; and he is the same as the Roman Dia, Orcus, or Tartarus. (b) The invisible lower or subterranean world in which dwelt the spirits of all the dead; the world of shades; the abode of the departed. The souls in Hades were believed to carry on there a counterpart of their material existence these the dead; the world of shades; the abode of the departed. The souls in Hades were believed to carry on there a counterpart of their material existence, those of the righteous without discomfort, amid the pale, sweet blooms of asphodel, or even in pleasure, in the Elysian Fields, and those of the wicked amid various tormenta. The lower world was surrounded by fiery and pestilential rivers, and the solitary approach was guarded by the monstrous three-headed dog Cerberus to prevent the shades from escaping to the upper world.

hading (hā'ding), n. [Verbal n. of hade, v.]

In mining, same as hade, 2. lar place at a particular time; hereness and nowness. According to the Aristotellan view, matter is the germ of substance and receives forms in its development. But the scholastic doctors considered that the forms were first pure, and then became contracted in some way to individuality. It was early suggested that this was effected by the uniting of the form to matter. But then it was replied that matter is mere being, the most general of all elements. Hence, some supposed that forms were in themselves individual; others that they were individuated by quantity. Scotus maintained that a material substance is made individual, not by its own formal nature, by its quantity, or by its matter, but only by a distinct mode of being, like that which distinguishes a living reality from an idea. This is what he meant by a "positive determining entity," where entity must be distinguished from ens.

One of the numerous fine filaments which more or less completely cover the skin of most mammals, and constitute the characteristic coat of this class of animals; any capillary outgrowth from the

of animals; any capillary outgrowth from the skin. Hairs are extravascular, non-nervous, epidermal, or exoskeletal structures belonging to the same category as nails, scales, feathers, and other horny or cuticular outgrowths, being chiefly distinguished by their simplicity, and their extreme slenderness in proportion to their length, which may reach several feet. A hair consists of an outer or cuticular layer of cells, extremely variable in the details of their arrangement, generally im-pli muscie; c, a hair; d, an arrector pill muscie; c, sebaceous glands. arrangement, generally im-bricated and with their free

variable in the details of their arrangement, generally imbricated and with their free edges presenting away from the skin. These constitute the hair-cuticle or cortex, upon the nature of which largely depends the capability of being woven or felted of some kinds of hair, as wool. Inside the cuticle is a tabular shaft of longitudinal fibers, resulting from fibrillation of cells, which may contain a core of granular cells, the pith or medults of the hair. Air finds its way into the interstices of the pith. Many hairs are quite cylindrical, or have but slightly reniform cross-section; such are apt to be long, slender, and straight, and possess the least felting properties, especially if their cuticular cells be also smooth. Curly, kinky, or woolly hairs, as of the negro's head or a man's beard, owe this character chiefly to the fact that they are flattened in different planes in successive parts of their length. Hairs of extreme length and fineness grow upon the head of women; others are of microscopic size, retaining, however, the same structural character. Hairs of great comparative thickness and stiffness are called bristles, as those on the back of swhe, the whiskers of a cat, etc. When still stouter and sharppointed, bristles become spines, as of the hedgehog; one

d, blunt, fiattened spine becomes a n; and a hair which tends to branch mer becomes a feather. (See feather.) An ordinary hair is divided into the root, which is inserted into the skin; the stem or shaft; and the point, which is the part into which the pith does not extend. The root is planted in a little pit or follicle formed by an inversion of the skin, the hair-follicle; this follicle has a dermic and an epidermic layer, and some of the latter which adheres when a hair is plucked out by the root is commonly enlarged or bulbons, constituting the hair-bulb. Associated with the hair-follicle may be one or more sebaceous glands is called the root-sheath. The root is commonly enlarged or bulbous, constituting the hair-bulb. Associated with the hair-follicle may be one or more sebaceous glands whose secretion keeps the hair glossy, and tiny muscles (arrectores pill) are sometimes attached to the sheath of the root, whose action may cause the hair to bristle or "stand on end." (See horripilation.) Hair is sometimes coloriesa, but oftenest heavily pigmented, giving animals their natural colors, in which various shades of black, brown, and gray, with flaren or yellow, are the commonest, the purer reds, blues, and greens belies, covery of hair, growing on the papilla (1): 2 cutical substance of the shaft, the medulla not being visible; c, newest portion of hair, growing on the papilla (1): 2 cutical between driving comparatively rare. In all species of mammals, including man, the hair attains a definite longth on certain areas of the longth on certain areas of the start of continuity of the hairs of hair-sac, corresponding to that of their continuity of the surface and overlying a for colors of hairs; one comparatively rare, shorter, and more curly set, among the roots of which latter a still finer coating of hairs may be found growing inside any of the matural openings of the body, as the ears, nostrils, mouth, and various cutaneous pouches of different animals. Like other horny structures, hairs are often a secondary sexual character, either appearing on certain parts of the body coincidently with the maturity of the sexual function (see puberty), or growing in a certain way in one sex and not in the other, as the human beard, the mane of the lion, etc. Though hairs are in themselves non-nervous, certain hairs on some animals constitute feelers or tactile organs of great delicacy; such are known as tactile hairs.

3. On animals, with the exception of most mammals, a filament; any fine capillary or hair-like outgrowth from the body or any part of it, but especially its surface; one of the objects which compose the hairiness, pubescence, or pilosity of an animal, or such objects collectively: used in both the singular and the plural: as, the singular that which elethers hair or hairs of a caterpillar, that which clothes or those which clothe a lobster's gills, etc. Most members of the animal kingdom have hair or hairs of some kind, resembling the peculiar covering of mammals more or less nearly in appearance or function, or both, and consequently taking the same name, though the structural character of these appendages may be entirely different.

hair-follicle (hār'feŦH'er), n. A tubular depression of the skin from the bottom of which a hair grows. It consists of a dermic and an epidermic cost. The latter is next to the root of the hair, to which it commonly adheres when the hair is plucked, and may easily be seen with the naked eye. It is directly continuous both with the cuticular surface of the skin and with the root of the hair itself. The dermic coat is similarly continuous with the corium or true skin, but distinct from the hair, and may often be separated into three recognizable layers: a basement membrane next to the cuticular layer of the follicle, a middle muscular or at least contractile layer, and a third layer of connective tissue. Associated with the follicles are the nutrient blood-vessels, nerves, sebaceous glands, and special muscules. A hair-follicle is also called a root-sheath, a name sometimes restricted to its epidermic layer. See cut under Aair1.

Specifically—(a) In medieval palaces and castles, the main room, often the only living-room. Besides the hall, in very early times, even in the greatest houses, there were only a few sleeping-rooms, and not always these. In such a hall the lord and his family, retainers, servants, and visitors were all accommodated, and all public and household affairs were carried on. Later rooms more retired were added, but throughout the feudal period the hall remained the common center of activity. Westminster Hall in London was originally a part of the royal palace where all the common life of the royal court was conducted and the king dispensed justice. This great room continued to be the principal seat of justice in England till 1820.

hallel (hal'el), n. [Heb., praise.] In Jewish ritual, the hymn of praise, beginning in the original with the word halleluiah, 'Praise ye the Lord,' and consisting of Psalms cxiii. to ritual, the hymn of praise, beginning in the original with the word halleluiah, 'Praise ye the Lord,' and consisting of Psalms exiii. to exviii. inclusive, chanted in the temple while the Passover lambs were being slain, and also at the Passover supper. This hallel or song of praise, called the Egyptian hallel because the slaying of the Passover lambs was first commanded in Egypt, was also chanted at the sacrifice on the first day of the Passover, after the morning sacrifice on the feast of Pentecost, on the eight days of the feast of Tabernacles, and on the eight days of the feast of Tabernacles, and on the eight days of the feast of the Dedication. Another, called the great hallel, consisting of Psalm exxxvi., or seconding to some of Psalm exxxv. 4 to the end of Psalm exxxvi., was chanted by those who wished a fifth cup at the Passover feast, and also on occasions of great joy.

1. Praise ye the Lord: a word used in songs of praise or pious rejoicing, or in solemn ascriptions of thanksgiving to God. It is also used as a noun. It occurs in the English Bible only in Rev. xix. 1, 3, 4, 6, and then in the Greek form, as alleluia. This is the form employed in liturgical usage. It is found in liturgies and offices from very early times. Its most prominent liturgical use is that after the epistle and before the gospel in both the Eastern and Western churches. (See gradual and jubilation.) In the Mozarabic rite it follows the gospel. (See Lauda.) There are probably traces of an original, perhaps Jewish, use of halleluiah before and after psalms. The Greek Church has a triple "Alleluia" at the end of the cherubic hymn. In the day-hours of the same church it is said after the gloria at the end of stasses or portions of psalms. In the Western Church it succeeds the gloria after the versicles at the beginning of the several hours. In Western usage alleluia is not said from Septuageaims to Easter eve.

I heard a great voice of much people in heaven, saying, Alleluia, salvatine and glory and honour and nower.

[Also written Halloween; short for Allhallowe'en, etc., All-hallows' even: see All-hallows, All-hallown, all-hallon, etc. Cf. Hallowmas.]

The evening of October 31st, as the eve or vigil of All-hallows or All Saints' day. Hallowe'en is an occasion of certain popular superstitions and observances in many Christian countries, fairies, witches, and imps of all kinds being supposed to be then especially active. In Scotland, as related in Burns's "Halloween," the evening is frequently celebrated by meetings of young people of both sexes, when various mystical or playful ceremonies are performed with the view of revealing future husbands or wives. The form Hallow-even is rare.

"This night is hallow-eve," he said, "And to-morrow is hallow-day."

Sir Roland (Child's Ballads, I. 224).

1. An unfounded notion; belief in an unreality; a baseless or distorted conception.

This must have been the hallucination of the transcrib who probably mistook the dash of the I for a T. Addie

2. In pathol. and psychol., the apparent perception of some external thing to which no real object corresponds. The mistaking of a bush for a bear in the dark is not hallucination, but only illusion; but the hearing of a voice when no sensible acoustic vibrations strike the ear is a very common hallucination. Hallucination may be of sight only, or of hearing only, or of both together. It may be consistent with perfect sanity and the absence of any false belief, and may even become an object of observation and study to the person affected.

For if vision be abolished, it is called excitas, or blindness; if deprayed, and receive its objects erroneously, haltucination. Sir T. Browne, Vulg. Err., iii. 1s. Illusion and hallucination shade one into the other much too gradually for us to draw any sharp line of demarcation between them.

halmalille (hal'ma-lil), n. [E. Ind.] A valuable tree, Berrya amomilla, abundant in Ceylon, and also widely dispersed throughout tropical Asia and Australia. It is the only species of the genus, and belongs to the natural order Tilices, being allied to the linden-tree. The wood is much used in boat-building, as it is believed to resist the attack of

marine worms, and also, by a certain oleaginous property, to preserve the iron from corrosion. It is exported from Ceylon to Madras, and used in building the Masula boats adapted to the beavy surf of that coast. Its light wood is there known as Trincomali-wood. It is also used in Ceylon in house-building, etc.

A luminous circle, either white or colored, seen round the sun or moon, and commonly of 22° or of 46° radius, the definite radii depending on the definite angles of ine average. monly of 22° or of 46° radius, the definite radii depending on the definite angles of ice-crystals. Sometimes one of these only is seen, and sometimes both appear at the same time. Halos are due to the retraction of light as it passes through minute ice-needles in the atmosphere. They are frequently accompanied by supernumerary circles, parhelis or mock suns, paraselense or mock moons, and variously arranged white bands, crosses, or arcs. All of these phenomena are the result of the refraction, reflection, and diffraction of light when it falls upon crystals of ice suspended in the atmosphere. Halos and their attendant phenomena are more frequent in winter than in summer, and are more commonly observed in the arctic regions than in warmer climates.

Halos must not be confounded with corons—those concentric rings which encircle the sun or moon when seen through a mist or cloud. Halos, as we have seen, are red inside, corons are red outside. The size of the corons depends on the size of the drops of water in a mist or cloud, being smaller as the drops of water in a mist or cloud, being smaller as the drops are larger. They are due to diffraction, and can only be explained by the help of the undulatory theory.

oi as in oil, joint, boy.
ou as in pound, proud, now.

A single dot under a vowel in an unac-cented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

as in prelate, courage, captain. as in ablegate, episcopal. as in abrogate, eulogy, democrat. as in singular, education.

A double dot under a vowel in an unac-cented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance ac-tually becomes, the short u-sound (of but, pun, etc.). See Preface, p. xi. Thus:

as in errant, republican.
as in prudent, difference.
as in charity, density.
as in valor, actor, idiot.
as in Persia, peninsula.
as in the book.
as in mature, feature.

A mark (-) under the consonants t, d, s, z indicates that they in like manner are variable to ch, j, sh, zh. Thus:

t as in nature, adventure.
d as in arduous, education.
s as in leisure.
s as in seisure.

th as in thin.
YH as in then.
th as in German ach, Scotch loch.
french nasalizing n, as in ton, en.

ly (in French words) French liquid (mos-nilé) l.
'denotes a primary," a secondary accent.
(A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)
